Dear Henryk:

Was expecting to see you on the "Cambrian" field trip - why didn't you come? There were "HOT LUNCHES" at noon time & cold beer! all of which you would have enjoyed I know.

On way over & back collected ammonites & gryphaea from the Comanche - still much confused about the gryphaea - found some ammonites that I can't recognize - yet!

Was checking my notes of the last trip - in big letters - "Write Henryk - DeFreneya Florida" It's a good idea to keep all sorts of information in your notes - so immediately I take pen in hand. Any not done as to well name & depth that you can give out?

Tomorrow go to Dallas - will run a couple plane table sections in the Eagle Ford - lithologies & fossil zones & what is the base of the Eagle Ford? That's the problem. How do you limit the top & bottom of a formation - physical evidences of disconformity - sharp lithological changes - fossil's ranges? I note that you see evidences of disconformities - top & bottom - for many of your stratigraphic units - it then appears you embrace your fossil ranges to conform to your disconformities. Am I reading correctly? Will be seeing you - hope all is well

Sincerely Roy.
