**On the Role of the Laboratory in Learning Chemistry**

**by**

**Michael Jeffrey Elliott, B.A.; M.A.T.**

**Dissertation**

Presented to the Faculty of the Graduate School of

The University of Texas at Austin

in Partial Fulfillment

of the Requirements

for the Degree of

**Doctor of Philosophy**

**The University of Texas at Austin**

**May 2006**

## **Dedication**

To P.A.K.

## **Acknowledgements**

I would like to thank the entire faculty of the Department of Physical Sciences at Barry University in Miami Shores, Florida, for their encouragement and support in my returning to graduate school to work on my Ph.D. In particular, I want to recognize Dr. Mary Ann Jungbauer and Sister Marie Joannes O'Donnell, O.P., Ph.D., both retired from Barry University, for acting as my mentors as I began my teaching career.

To my fellow Chemical Educators in the Collaborative for Chemical Education at The University of Texas at Austin, I owe a debt of thanks for their many stimulating and insightful discussions of all things “Chem Ed.” Special thanks go to Dr. J. J. Lagowski for his admonishments to “press on, regardless” and “keep the faith” and for his patience, suggestions, and guidance through my years here at The University. A note of gratitude is extended to Dr. Kent K. Stewart, my “partner in reform”, for his insight and mentorship. Rita Wilkinson has been a great friend and supporter not only to me, but to all of the Collaborative for Chemical Education, as we sought to achieve our individual and collective goals.

Finally, I acknowledge Paul Kamarauskas for the sacrifices he made during my time in graduate school. Without his support, my lifelong dream of completing the Ph.D. may never have been realized.

Supervisor: J. J. Lagowski

Chemistry is a laboratory science; hence, no instruction in chemistry would be complete without some laboratory component. But in a discipline as wide-reaching as chemistry is, the natural questions of *what* should be taught and *how* it should be taught are not trivial. Indeed, these questions have been on the minds of chemical educators for many years.

Current instructional models in chemistry laboratories can be grouped under several broad descriptions. *Expository laboratories* are intended to illustrate important chemical principles. While these laboratories offer the benefit of reinforcing lecture-based instruction, students often know the outcome of such experiments in advance, and this model of instruction does not accurately depict the process of accumulating scientific knowledge. To address this apparent shortcoming, inquiry models have been developed. *Discovery (or, Guided inquiry) laboratories* focus primarily on the scientific method, providing students with some instruction towards addressing the problem at hand, but also requiring students to develop some decision-making processes of their own. *Inquiry (or, Open inquiry) laboratories* provide less assistance to the students, effectively

obligating them to develop complete procedures for themselves. The difficulty with these models is that content almost becomes irrelevant; the focus is on the process of obtaining scientific information. Even then, these models still do not accurately reflect the nature of scientific work; scientific inquiry always begins from some knowledge base, which these models do not presuppose.

Feeling that none of these models adequately addresses the needs of chemistry students, at The University of Texas at Austin we have developed a new General Chemistry laboratory course based on the idea of introducing students to chemical research. As a model, we employed Cognitive Apprenticeship theory, which is based on traditional craft apprenticeships but is adapted to cognitive domains. It appears to be suitable as a model for laboratory instruction because it assumes that content matters, that the sequence for that content is important, and interaction between the instructor/ mentor and the student/ apprentice is essential. Both the immediate and longitudinal effects of the research-based course on introductory students are compared to those of a standard Expository laboratory course.

## Table of Contents

List of Tables .....	xii
List of Figures .....	xxi
Chapter 1: Introduction .....	1
Overview .....	1
Literature Review .....	2
Expository Laboratories .....	9
Discovery Laboratories .....	9
Inquiry Laboratories .....	10
Problem-Based Laboratories .....	11
What We Know about Laboratory Instruction .....	11
Do Laboratory Courses Help Reinforce Concepts? .....	12
Do Laboratory Courses Improve Laboratory Skills? .....	13
Do Laboratory Courses Convey Scientific Processes? .....	13
Do Students Acquire Positive Attitudes towards Science as a Result of Laboratory Instruction? .....	14
Do Students Learn Facts about the Nature of Chemistry as a Result of Laboratory Instruction? .....	14
Summary of What We Know and its Implications .....	15
A Concurrent Thread .....	16
Cognitive Apprenticeship Theory .....	18
Chapter 2: Experimental .....	21
Steps Towards a New General Chemistry Laboratory Course .....	22
Applying Cognitive Apprenticeship Theory to the New Course .....	27
Structure of the New Course .....	31
Data Collection .....	38
Chapter 3: Data Analysis .....	40
Spring 1998 .....	40
Survey Data .....	40

Student Persistence .....	43
Interviews.....	44
Overview of the Analysis From Fall 1998 Through Spring 2001 .....	44
Survey Data.....	45
Drop and Withdraw Data .....	46
Longitudinal Studies .....	47
Enrollment in Research Courses .....	47
Retention in Science and Engineering Majors.....	48
Fall 1998 .....	51
Survey Data.....	52
Drop and Withdraw Data .....	64
Longitudinal Studies .....	66
Enrollment in Research Courses .....	67
Retention in Science and Engineering Majors.....	71
Control Versus Experimental For Spring 1999, Fall 1999, Spring 2000, And Spring 2001 .....	75
Survey Data.....	76
Drop and Withdraw Data .....	91
Longitudinal Studies .....	96
Enrollment in Research Courses .....	98
Retention in Science and Engineering Majors.....	106
Evaluation of The Effect of the Teaching Assistant .....	115
Survey Data.....	115
Drop and Withdraw Data .....	126
Longitudinal Studies .....	126
Enrollment in Research Courses .....	127
Retention in Science and Engineering Majors.....	131
Effect of a Different Instructor on the Experimental Course.....	135
Survey Data.....	135
Drop and Withdraw Data .....	148
Longitudinal Studies .....	150
Enrollment in Research Courses .....	151

Retention in Science and Engineering Majors.....	155
Effect of the Experimental Course on an At-Risk Student Group.....	158
Survey Data.....	159
Drop and Withdraw Data.....	170
Longitudinal Studies.....	172
Enrollment in Research Courses.....	174
Retention in Science and Engineering Majors.....	181
Summary of Findings.....	188
Survey Data.....	189
Drop-Withdraw Data.....	190
Enrollment in Subsequent Chemistry and Biology Research Courses.....	190
Enrollment in Subsequent Natural Sciences Upper Division Research Courses.....	191
Retention in Science and Engineering Majors.....	192
Chapter 4: Discussion.....	194
Group Comparisons.....	194
Fall 1998: Control versus Experimental when the Groupings are Truly Random.....	194
Spring 1999 Onward: Control versus Experimental.....	195
Does the Teaching Assistant Make the Difference? Control versus Experimental when the Same TA Teaches Both Courses.....	199
The Effect of the Instructor: Control versus Experimental when a Different Instructor Teaches the Experimental Course.....	200
The Effect of the Experimental Course on an At-Risk Student Group.....	202
Overall Conclusions.....	205
Interest in Science.....	205
Confidence in Success.....	207
Enrollment in Research Courses.....	210
Persistence as Science Majors.....	210
Suggestions for Future Work.....	211

## **Chapter 1: Introduction**

### **OVERVIEW**

For as long as chemistry has existed as a discipline, there has been chemistry instruction. And concurrent was the notion that what we were teaching as part of that instruction was incorrect for some reason or another. What made it incorrect was not so much the content being taught, it was the approach that was a part of that instruction. This notion actually drove the father of laboratory instruction, Justus von Liebig, to reform laboratory instruction in the 1820s as he had observed that, in his view, “nobody understood how to teach analysis.”<sup>1</sup> Later, in the early 1900s, focus shifted to demonstrations as a time- and cost-effective means for teaching about chemical phenomena. But chemists of the time noticed that there was some value, even if they could not define it, in having students perform experiments for themselves. As the discipline matured and other political and social realities began to impact chemistry instruction, educators began to wonder if the laboratory course might be a vehicle for developing critical thinking skills. And as a result, a whole host of chemistry laboratory courses were developed in the hopes of having students learn how to ask, and answer, questions in the sciences. Still, the success of such approaches is yet to be known. So nearly 200 years after Liebig’s establishment of formal laboratory instruction in Giessen, we are still faced with the same fundamental question: what purpose should laboratory instruction serve?

To this end, and in following Liebig’s lead two centuries ago, a laboratory course based around the idea that laboratory work was essential to advancing chemical knowledge was developed at The University of Texas at Austin. The natural mechanism by which this happens is through chemical research, so an introductory course designed

to introduce beginning chemistry students to chemical research was created. An operational model for such a course was found in Cognitive Apprenticeship theory<sup>2</sup>. Cognitive Apprenticeship resembles traditional craft apprenticeships in that it involves the interaction of an expert and a student, and the student is led through a series of exercises in the expectation that the skill set possessed by the expert will be assimilated by the student; , the skill set in Cognitive Apprenticeship also involves cognitive skills, rather than only physical and manipulative skills as in traditional apprenticeship. A General Chemistry course intended for life science students was designed, taught, and evaluated over the course of several semesters using the framework proposed by Cognitive Apprenticeship, adapted for the realities of the General Chemistry laboratory. This dissertation documents the efforts made in this regard and the results obtained therefrom.

## **LITERATURE REVIEW**

The beginnings of modern chemistry began to emerge in the late 18<sup>th</sup> century; early chemists recognized the importance of experimental evidence for the advancement of chemical knowledge. Lavoisier's "Chemical Revolution" in the 1770s provided the foundation for experimental methods that would continue to be refined through Dalton's time, and beyond. At the beginning of the 19<sup>th</sup> century, Dalton formulated his Atomic Theory, which was considered a significant breakthrough in chemical thought. His work was based on careful experimentation and observation, and he was able to establish the relative masses for 17 known elemental substances in 1803. As the body of accepted methods and procedures began to develop, it is only natural that instruction in those methods and procedures would follow.

The practice of chemistry, usually in the laboratory, was the focus of the early discipline and, by association, the focus of formal chemistry instruction. Indeed, many

early chemists recognized this condition, particularly Justus von Liebig. Liebig understood the importance of training people to perform the most essential chemistry techniques of the time in order to advance the discipline. Upon arrival at the University of Giessen in 1824, Liebig set out to develop a program of laboratory instruction that ultimately became the model for the chemical world. At the beginning of Liebig's career in Giessen, it was common to have students pay instructors directly for their services, and the costs of instruction were then borne by the instructor, rather than the university. This arrangement ordinarily caused laboratory instruction to be lacking, because such instruction was relatively costly then, as it is now. However, even with his first contract, Liebig had the University of Giessen create a budget for laboratory expenses, even if the sum was not sufficient for all of the expenses. Once Liebig established his reputation, the University of Giessen increased the budget for laboratory instruction such that it eventually covered all of its costs. This model was eventually copied by other German universities, and eventually by other universities throughout the world.

However, it is not in the details of financing laboratory instruction that Liebig would leave his greatest mark on chemical education. Liebig also set out on a course of laboratory instruction that ultimately would be the model for the world. His instruction started students on analyzing known compounds in a set sequence. Once the student made it through the "alphabet" of 100 compounds, he/she was allowed to pursue analyzing new compounds, ones not previously characterized. This method proved useful to students and to Liebig personally; they were able to perform elemental analyses on naturally occurring compounds in the new and developing realm of organic chemistry. Liebig developed a laboratory manual to describe his program; published simultaneously in German and English, it became the standard laboratory program throughout Europe.

Perhaps the most remarkable feature about Liebig's model of laboratory instruction was that it had a very practical goal; it was designed to develop chemists capable of performing analyses using the best equipment available to chemists at the time. It was his observation that "nobody understood how to teach analysis" that caused him to establish what many consider to be the first systematic laboratory instruction in his labs at Giessen<sup>1</sup>. However, laboratory work had been offered to students prior to Liebig's time. Friedrich Stromeyer first began offering laboratory work to students in Göttingen in 1806, J. N. von Fuchs followed at Landshut in 1807, Döbereiner at Jena after 1811, and N.W. Fischer at Breslau after 1820.<sup>3</sup> Even then, outside Germany, laboratory instruction was offered that predates any of these timeframes. The earliest known university laboratories actually began at the beginning of the seventeenth century.<sup>4</sup> Whether or not those laboratories could properly be called chemistry laboratories is debatable: most chemists acknowledge the beginnings of modern chemistry to have taken place at the end of the eighteenth century. Still, the notion that laboratory instruction in chemistry is an important part of advancing the discipline appears to have been very much entrenched by Liebig's time at Geissen. Perhaps the most important contribution Liebig made in this regard was solidifying this thought and establishing a widely-regarded and imitated method for doing so.<sup>5</sup>

The process Liebig undertook was pedagogically sound in that it led students through a well-thought out sequence of experiments. This process, which Liebig began in the 1830's, is not much unlike what happens in graduate chemistry programs today, *viz.*, have novice students learn a technique (very often) from "expert" students. But one can argue that he was not likely the inventor of the process: he simply borrowed the idea from the tradesmen of the day. If a goal is to teach someone how to make horseshoes, for example, that person should know what the finished product should look like and how to

manipulate all of the implements required to make the horseshoes. And it also seems logical that the novice student be given a relative simple task before being asked to do something creative, different, or out of the ordinary. Indeed, it is through apprenticeship that many tasks were taught then and continue to be taught today. It has been said that a graduate student in chemistry “is probably as close to being a traditional apprentice as anyone in modern life.”<sup>6</sup>

Liebig may well have had a personal interest in developing analysts as he needed capable personnel to establish the composition of many organic compounds. Indeed, it is through the work of analysts that the foundations of organic chemistry were laid. Once composition was known and empirical formulae established, patterns could be recognized, and the notion of functional groups (at that time, collections of atoms that were repeated from one compound to another) was developed. But the success of his approach was quickly recognized throughout the chemistry community and shortly thereafter other chemists of the day were employing his approach to train analysts. The idea of systematic laboratory instruction in chemistry had taken root, and his approach acted as a catalyst for changing the way chemistry was taught and understood.

Since that time, laboratory instruction in chemistry has been universally viewed as an important part of chemical research and, it follows, of the chemistry curriculum. Arguably, the discipline may not have developed as quickly as it did through the 1800s without this systematic approach which produced capable and competent chemists. By the 1860s, as a result of this work, Mendeleev worked out the first modern periodic table and Kekulé proposed a structure for benzene. Essentially the facts of chemistry were being consolidated into bigger ideas, concepts, and theories. In order to establish an overarching philosophy for the discipline, enough observations had to be collected to create the larger message. When the discipline became sufficiently mature for this to be a

reality, a new venue for chemistry instruction suited to transmit the philosophy of chemical thought was to be developed: the lecture. The lecture was where the basic knowledge in chemistry could easily be transmitted, while the laboratory could train students how that knowledge was obtained. There was, and continues to be, a great deal of synergy between the lecture and laboratory components in chemistry instruction. Indeed, much as Liebig discovered, a systemic approach to instruction of chemical manipulations works well in the lecture course, and nearly all institutions of higher learning take students on a very similar path towards an enlightenment in chemistry.

Yet while lecture instruction in chemistry has become largely standardized through organizing the course by way of theoretical principles rather than descriptive chemistry<sup>7</sup>, laboratory instruction in chemistry from institution to institution, and even between laboratory courses within an institution, has become widely divergent. This may be the result of the ever widening of understanding in chemistry, since many laboratory skills, not just elemental analyses as in Liebig's day, might be considered essential towards understanding how knowledge in chemistry is attained. Indeed, some chemists now believe that laboratory instruction in chemistry has been rendered irrelevant<sup>8</sup> as the tools and techniques used in modern chemistry are well beyond the grasp and interest of novice students expected to take chemistry courses. This difficulty immediately poses a question: what function should a laboratory course in chemistry serve? Is it to reinforce or illustrate concepts that appear in the lecture course? Is it to interest students in a career in chemistry or some other science? Can it enhance self-confidence in novice chemistry learners? Is it to demonstrate the scientific method? Can it still be a method to elicit change in the discipline of chemistry as in Liebig's day? Or, indeed, is it parts or all of these?

The answer to that question is partly philosophical and partly practical. Part of that philosophy involves the chemist's *belief* that chemistry begins in the laboratory. Nothing we truly understand about our discipline has been achieved without careful experimentation, except perhaps for a few theoretical constructs, which ultimately are verified by experiments later. Maybe it is because of the chemist's desire to "prove it in the lab" that all chemists naturally gravitate towards training new students in our discipline in the laboratory from the very beginning of their studies. Yet it is also clear that only a small number of these students actually go on to study our discipline in detail. For example, only about 3% of the students enrolled in Introduction to Chemical Practice, the General Chemistry laboratory course at The University of Texas at Austin, identified Chemistry as their major in Fall 1998. Furthermore, the idea of training students in the laboratory is not unique to our discipline. Rather, scientists hold a nearly universal belief that some laboratory instruction is essential to a student's education.<sup>9</sup>

But has this instruction been successful in achieving certain goals? And does this universal belief have any merit? Various teaching chemists have proposed certain goals for laboratory instruction in chemistry. H.I Schlesinger<sup>10</sup>, the great experimental boron chemist, for example, *believed* that laboratory instruction had the following goals:

1. To illustrate and clarify principles discussed in the classroom, by providing actual contact with materials.
2. To give the student a feeling of the reality of science by an encounter with phenomena which otherwise might be to him no more than words.
3. To make the facts of science easy enough to learn and impressive enough to remember.
4. To give the student some insight into basic scientific laboratory methods, to let him use his hands, and to train him in their use.

While no one would doubt that these are worthy goals, several other reasonable goals were not considered by Schlesinger. One particularly notable goal was expressed by Pickering, who noted that "if lab is to illustrate something let it be the scientific

method"<sup>11</sup>. More recently, Michael Abraham<sup>12</sup> undertook a study in which various goals for laboratory instruction were evaluated by chemistry faculty at 199 institutions with ACS-approved programs in chemistry. The rankings of these goals are shown in Table 1 below:

Table 1: Relative Importance of Laboratory Goals

Concepts	2.12
Laboratory Skills	2.43
Scientific Processes	2.49
Positive Attitudes	3.71
Learning Facts	4.31

(1=highest, 5=lowest)

One easily sees how the items on the Schlesinger list correspond to those on the Abraham list. Schlesinger's goal to "illustrate and clarify principles" corresponds to "Concepts" in the Abraham survey. Training students in laboratory skills ("laboratory methods") appears on both lists, as well as learning facts (giving "the student a feeling of the reality of science") and engendering positive attitudes ("easy enough to learn and impressive enough to remember"). The goal of training students in scientific processes, which Schlesinger did not include but Pickering suggested, appears as well on the laboratory survey.

Arguably, based on the observations of Schlesinger and Abraham, the goals for laboratory instruction appear to be clear and nearly universally agreed upon. In an effort to address these goals, various "styles" or "formats" of laboratory instruction have been developed. According to Domin<sup>13</sup>, four distinct styles of chemistry laboratory instruction exist: expository (also called traditional verification laboratories), discovery (sometimes called guided or directed inquiry laboratories), inquiry (or, open inquiry laboratories), and

problem-based. The various styles of laboratories, in Domin's view, are differentiated based on outcome, approach, and procedure.

### **Expository Laboratories**

Expository laboratories are designed to confirm a concept or principle. Of all types of laboratory schemes, these are the most directed, providing virtually no opportunity for students to explore concepts on their own. A great deal of this direction is focused on developing laboratory skills either by following the teacher's instructions or by reading a laboratory manual.<sup>14</sup> Aside from the emphasis on developing laboratory skills, learning facts is perceived as the most important goal within this framework of laboratory instruction. Little emphasis on thinking is placed within expository laboratories.<sup>15</sup> The outcome of expository laboratory experiments is often known to the students even before they undertake the experiment. Thus the whole exercise becomes an effort to verify what the students already know. This format for laboratory instruction has often been criticized as being a "cookbook" for the convenience of the instructional staff, in an effort to minimize resources expended, in particular time, space, equipment, and personnel.<sup>16</sup> Despite the criticism of expository laboratories, the vast majority of laboratory courses in chemistry, judging from content analysis of commercially available laboratory manuals, are taught in this manner.<sup>17</sup>

### **Discovery Laboratories**

Discovery laboratories are, in a sense, designed to be a bridge between expository laboratories and inquiry laboratories. This type of laboratory provides an exercise in which students follow a detailed procedure as in expository laboratories, although the result of that experiment is not known to them, as in inquiry laboratories. In this format of laboratory instruction, students study a specific phenomenon (or a series of phenomena) and then from their observations, induce the general principle(s) behind the

phenomena. The chief disadvantage of discovery laboratories is that they are more time consuming than expository laboratories. But beyond the time aspect, discovery laboratories also are subject to failing because students may not actually discover what the laboratory intended for them to discover.<sup>18</sup> This format for laboratory instruction is designed to develop investigative strategies, data-handling and analysis, pattern recognition, and teamwork skills. The discovery laboratory format is meant to address the perceived weaknesses of the expository laboratory format by focusing more on concepts and scientific processes more than do expository laboratories. A combined discovery/ inquiry laboratory sequence was implemented by Pavelich and Abraham<sup>19</sup> as early as 1979; an experimental group having a laboratory course taught in this format was shown to have a gain in abstract thinking ability relative to a control group which followed a traditional verification laboratory sequence. However, the conclusion that the authors come to should be approached with some caution: the students compared in the study came from two different institutions of higher learning. In 1996, the National Research Council set new standards in science education advocating more inquiry-based laboratory instruction<sup>20</sup>; in response, teaching chemists have developed laboratory curricula based on the discovery approach. An example of a two-year laboratory sequence was developed by Ricci, Ditzler, Jarret, McMaster, and Herrick<sup>21</sup> as a part of a discovery learning-based curriculum. Discovery laboratories are more common than inquiry laboratories.

### **Inquiry Laboratories**

Inquiry laboratories are intended to develop true research strategies and the same skills as discovery laboratories. This format is perceived as the ideal format for laboratory instruction in that it mimics the scientific process. However, inquiry as it is expressed in instructional settings and scientific research are not one and the same<sup>22</sup>; in

inquiry laboratories, students study well-understood phenomena. This format, in which students design their own experiments *de novo*, is considered the hardest format to implement, but it may produce a better understanding of chemistry concepts than traditional laboratory experiences.<sup>23</sup> Examples of inquiry-based laboratory courses have been reported<sup>24</sup> and a combined discovery/inquiry laboratory manual based on the work of Pavelich and Abraham previously discussed is commercially available.<sup>25</sup> In spite of the interest in inquiry-based laboratories, only 8% of colleges and universities actually use them, according to the Abraham<sup>12</sup> study.

### **Problem-Based Laboratories**

Unlike discovery and inquiry laboratories, problem-based laboratories employ a deductive approach to learning. Students must be exposed to a concept before performing an experiment in a problem-based curriculum. In this format, students are given a scenario for which they must find a resolution using the concepts to which they have been exposed.<sup>26</sup> This approach parallels what happens in the real world and provides for an informed and efficient resolution to the problem.<sup>27</sup> Many paths may be appropriate to achieving the final goal, which is the resolution of the problem. Problem-based laboratories, with their requirement of having students integrate concepts to which they have already been exposed, are more common among upper-division laboratory courses, such as Analytical Chemistry.<sup>28</sup>

### **WHAT WE KNOW ABOUT LABORATORY INSTRUCTION**

Since the goals of laboratory instruction are fairly well agreed upon, one would think that teaching chemists would have been successful in meeting these goals. But the literature in the area of laboratory instruction suggests discouraging reviews regarding the effectiveness of laboratory instruction. Considering the larger goals of laboratory instruction, we should consider to what extent we know whether:

1. Laboratory courses help reinforce concepts from the lecture course;
2. Laboratory courses improve laboratory skills;
3. Laboratory courses convey scientific processes;
4. Laboratory courses promote positive attitudes towards science;
5. Students learn some facts about the nature of chemistry and chemicals as a result of laboratory instruction.

### **Do Laboratory Courses Help Reinforce Concepts?**

According to the Abraham<sup>12</sup> survey, the most important goal of laboratory instruction is developing chemical concepts. Yet a review of the literature provides little evidence that laboratory instruction does, in fact, achieve this goal if we consider how the laboratory course impacts the (usually) associated lecture course. Several studies of how students perform on objective achievement tests in lecture courses have been undertaken. Cunningham<sup>29</sup> and Kruglak<sup>30</sup> in Physics; and Brown<sup>31</sup> and Bradley<sup>32</sup> all focused on whether demonstrations in the lecture setting were as effective as laboratory work towards achievement on an objective test in the lecture setting; all studies showed there was no difference between students who had performed laboratory work and students who had an equivalent demonstration experience. Kruglak<sup>33</sup>, in a subsequent study, divided freshman physics students into three groups: one which had a conventional laboratory course, another which had the same experiments demonstrated to them, and the third which had no laboratory or demonstration experience at all. No difference was found among any of the groups on lecture examinations. Dubravcic<sup>34</sup> considered alternatives to laboratory instruction, films and discussion sessions, for non-science basic chemistry students. No difference in achievement on the final examination was observed

between students who undertook laboratory instruction versus either students who viewed films related to lecture course content or students who attended a discussion section. It is possible that laboratory instruction does provide some insight into chemical phenomena that is neither easily nor ordinarily measured, but it also appears that laboratory instruction for the sole purpose of improving test results in the lecture course as tests are ordinarily administered is fruitless.

### **Do Laboratory Courses Improve Laboratory Skills?**

On the surface, it seems obvious that students who receive training in manipulative tasks in the laboratory are certain to be more proficient at those tasks than students who receive no such training. Indeed, Ben-Zvi *et al.* found that high school students performing chemistry laboratory work performed better on a test of manipulative skills related to laboratory work than students who had watched films demonstrating laboratory experiments.<sup>35</sup> Assessing laboratory operational skills by way of a paper-and-pencil test is impossible<sup>36</sup> and as a consequence, Ben-Zvi *et al.* employed a checklist of manipulative skills that had been previously described.<sup>37</sup> So, while it seems that the obvious is true, there is still a complicating factor to this question in that there is no wide agreement on the nature of the technical skills a student should have acquired as a result of a General Chemistry laboratory experience.

### **Do Laboratory Courses Convey Scientific Processes?**

Arguably, laboratory courses should also enhance and develop cognitive skills as well as manipulative skills. Cognitive skills such as planning an experiment and learning to draw conclusions from observations should be part of the laboratory experience. But students spend more time determining if they obtained the correct results rather than designing the experiment in the expository model<sup>38</sup>, indicating that students would have little opportunity for higher-order cognitive thinking. Domin<sup>17</sup> observed in his analysis

of the content of commercially available laboratory manuals that very few of them would promote cognitive growth. Hill observed that college student creativity, as measured by a general instrument to measure creative thinking, improved with involvement in chemistry laboratory activities.<sup>39</sup> The combined discovery/ inquiry laboratory sequence by Pavelich and Abraham<sup>25</sup> discussed earlier indicated that students exposed to a discovery/ inquiry format was shown to have a gain in abstract thinking ability compared to a control group which followed a traditional verification laboratory sequence; results of that study should be viewed cautiously. Both Wheatley<sup>40</sup> and Raghubir<sup>41</sup> observed the development of high-level cognitive abilities as a result of biology laboratory instruction. The enhancement of scientific thinking skills appears to be a possible outcome of laboratory instruction.<sup>42</sup>

### **Do Students Acquire Positive Attitudes towards Science as a Result of Laboratory Instruction?**

Ben-Zvi discovered that laboratory work was the most effective instructional method for promoting interest and learning in high school chemistry students when compared to teacher demonstrations, group discussions, filmed demonstrations, and lectures.<sup>43</sup> This discovery corresponds to Pickering's observation that the value of the laboratory might be in the affective, not cognitive domain.<sup>44</sup> Perhaps laboratory instruction does not change students' understanding of concepts but changes the way they connect or value concepts instead.<sup>45</sup>

### **Do Students Learn Facts about the Nature of Chemistry as a Result of Laboratory Instruction?**

According to the Abraham<sup>12</sup> survey, this particular goal of laboratory instruction is not highly valued at this time by the majority of teaching chemists. Factual information was more highly valued in the 1950s when Qualitative Analysis was more commonly a large part of the laboratory curriculum, but by the 1960s, emphasis shifted to

the development of scientific processes.<sup>46</sup> The American Chemical Society Examinations Institute has developed several small-scale laboratory assessment activities in which students are expected to design experiments to address several very common General Chemistry laboratory questions.<sup>47</sup> These examinations hope to demonstrate improved problem-solving skills, but they promise to be difficult to administer and perhaps again so content-specific that no improvement in general problem-solving skills might be observed.

### **Summary of What We Know and its Implications**

Gallagher observed that laboratory teaching had a potential for the teaching of science, even if that potential was unrealized; however, its instructional role was still uncertain.<sup>48</sup> Since the laboratory provides an opportunity to develop manipulative skills in students, we should carefully choose the skills we deem necessary for students to have after completing a course. As the laboratory course does not appear to help students with concepts from their associated lecture course, at least not in a way that we ordinarily measure, we are free from structuring the laboratory around the lecture course. The laboratory course does hold some promise as a means for developing scientific thinking skills in students, provided the laboratory is structured in a way to do so. The laboratory course is uniquely suited to demonstrating how the discipline advances and the source of knowledge in the discipline. Students appear to find laboratory experiences the most interesting of all of the modes of conveying the nature of chemistry to them. Capitalizing on this interest is a good way to recruit and retain students in the field. Finally, it may be a means of demonstrating the some facts about the nature of chemicals, even if that goal is not as valued as it once was.

## **A CONCURRENT THREAD**

Even without a comprehensive review of the literature to understand the role of laboratory instruction, there are signs that a great many teaching chemists are unhappy with the approach to laboratory instruction in chemistry that is being taken in many places today. From the 1960s forward, various initiatives to improve laboratory instruction and encourage students to pursue a career in science have been undertaken. These approaches invariably involve making student work in the laboratory approximate the research process. Various reports on science education have indicated that inquiry-based laboratory experiences are valuable to students. The goal of such exercises is to mimic the research experience, in that they ask students to (1) recognize and formulate a scientific question, (2) identify an approach that should give an answer to that question, (3) and manipulate the equipment and carry out the experiment in a manner that should give an unambiguous answer to that question. Within each step of this process, some basic understanding about the discipline must be known to the student and it is unrealistic to assume that the novice student could perform each of these steps without a great deal of coaching. Indeed, the Achilles heel of most inquiry-based instruction is that it assumes that students are innately capable of solving scientific problems on their own. Although students may be capable of formulating scientific questions, their knowledge of the nature of the techniques and approaches that are capable of answering those questions is likely to be lacking. For students to learn how to approach scientific questions, they need to have a roadmap, a context in which the question is posed. And they must, as the practitioner of any trade must, envision the final product as a whole, so they can see where their work will lead, so they recognize the individual tasks that have to be performed in order to obtain the finished product. Additionally, there have been programs which are designed to encourage research at the undergraduate level. The

National Science Foundation (NSF), through various programs, supports institutions that place research-grade equipment in small colleges and universities in the hope of having lower-division undergraduate students use these instruments. The fact that the NSF has taken on this initiative suggests that it sees value in Liebig's approach, namely, having students work on modern-day chemistry problems. Arguably these students gain a marketable skill as well, but the fact that these instruments are the basis of advancing the discipline by its natural method, research, that makes the program so valuable. Additionally, the Council for Undergraduate Research (CUR) encourages faculty in a great many disciplines, not just chemistry, to provide opportunities for students to engage in research. These programs are by necessity an apprenticeship; the faculty member must work one-on-one with each student, assisting students to ply their respective trades. Although many would argue that the research environment is a powerful learning and recruiting tool, it is difficult to implement on a larger scale, such as a laboratory classroom.

But is it possible to envision structuring a laboratory classroom on a research model? And how is a research model different than any of the formats for laboratory instruction that are currently employed today? The nature of research, not just in chemistry but in any science, is inductive. The outcome of research is not predetermined or known. Research involves capitalizing on previous knowledge and skills, but unlike many of the typical formats of laboratory instruction, research is focused on a narrow problem, explored in depth, rather than being a collection of unrelated experiments. Laboratory experiences intended to mimic the research experience should not involve a series of disparate experiences but rather a sequence of experiences as part of a coherent whole.

If the goal of laboratory instruction is to mimic the research experience, a new model for laboratory instruction will have to be found. Fortunately, such a model already has been described in educational theory, and it is called Cognitive Apprenticeship Theory<sup>2</sup>.

## **COGNITIVE APPRENTICESHIP THEORY**

Cognitive Apprenticeship Theory resembles training in traditional crafts, but it is adapted towards developing cognitive skills. It asserts that the learning environment has an associated sociology, the consideration of which cannot be ignored in developing curricula. Collins, Brown, and Newman identified five critical elements impacting the sociology of learning: situated learning, culture of expert practice, intrinsic motivation, exploiting cooperation, and exploiting competition.

### ***Situated Learning***

A key concept within Cognitive Apprenticeship Theory is that students carry out tasks and solve problems within the environment which is natural for the knowledge that is to be attained. For chemistry, the natural environment for exploring the nature of our discipline is within the laboratory. The laboratory provides a context in which chemistry questions are posed and answered using the tools, both physical and mental, of which chemists take advantage.

### ***Culture of Expert Practice***

Another key element of the Cognitive Apprenticeship Theory is the creation of an environment in which students communicate about and participate in the skills used by expert chemists. Students are able to observe and learn from an expert; however, just observing the expert is not enough, students must learn to think as the expert does. The expert must model the skills required to perform a task and induce, in whatever ways are possible, students to do the same. Chemistry teaching laboratories provide an ideal

context in which chemists, as experts, can display how they approach problems and the tools they use to solve them.

### ***Intrinsic Motivation***

Learning environments, such as laboratory courses, should promote intrinsic motivation for learning. Students are more likely to continue pursuing an activity if it provides an intrinsic reward to them. Careful selection of activities within a laboratory course may be intrinsically motivating to students if the activities are related to their experience and interest, making their learning in chemistry to seem related to other disciplines and to life in general.

### ***Exploiting Cooperation***

Chemistry laboratory courses are, by the very nature of laboratory settings, easily adapted to group work. Indeed, even if groups are not formally assigned, they may naturally spring up in laboratory courses because students are often working on the same problem and they have other students physically near them from which they can solicit advice. It is this character of the laboratory environment that can be capitalized upon to provide an additional opportunity for learning for students. Often other students may be the best source for advice to a student who is struggling with a concept, since those other students may have recently resolved that conflict for themselves; they understand it as a novice does and may be able to provide some insight in language that the struggling student will understand. The process benefits the student with the insight as well; he or she then has the opportunity to articulate and refine his or her knowledge.

### ***Exploiting Competition***

Competition can be a powerful motivator for some students. However, for other students, it may be intimidating. By establishing teams within the laboratory, any fears of competition that any individual students may have can be minimized if not quelled

entirely, so that the benefits of competition may be shared by all. Additionally, the establishment of teams within the laboratory course may provide an additional source of encouragement and motivation for students that may otherwise struggle on their own; it also provides an incentive to stronger students within each team to help the less able students. Chemistry laboratory courses, which can naturally be structured in terms of projects for teams of students, are easily envisioned as being composed of teams.

Having established that Cognitive Apprenticeship Theory may provide some insight in how a laboratory course may be structured, the proof of its effectiveness remains to be demonstrated. The details of arranging such a course and comparisons to a traditionally-taught course will be described in the next chapter. The ultimate goals for teaching a course in this new manner are to introduce students to the idea of laboratory work as a vehicle for solving questions in chemistry and to the nature of chemical research. This type of approach may be intrinsically more interesting and motivating to students and prompt them to continue forward in a science (perhaps chemistry) career. The research questions we should consider in deciding whether or not this new course is successful are:

1. Are students more likely to become interested in science?
2. Are students more likely to feel that they can be successful in a science career?
3. Are students more likely to pursue further research courses?
4. Are students more likely to persist as science majors?

These questions are addressed in turn over the course of the next few chapters.

## Chapter 2: Experimental

Two General Chemistry laboratory courses are taught at The University of Texas at Austin. One, identified as CH 317, is intended for chemistry, biochemistry, and chemical engineering majors only. The other, which is of more importance to this study, is intended for any student for whom chemistry is a required course of study, primarily life science students, and it has been taught to roughly 700 students each long (fall or spring) semester. This course is numbered CH 204 and it is independent of the lecture course in that students register for it separately, that is, independently of the General Chemistry lecture courses CH 301 and CH 302. The course has as its only prerequisite the first half of General Chemistry lecture (CH 301); as a rule, students take it concurrently with or subsequent to the second half of General Chemistry, (CH 302). As The University has a very large number of students taking chemistry and its teaching laboratory resources are limited, the Department of Chemistry and Biochemistry decided many years ago to offer only one semester of General Chemistry laboratory instead of the more conventional two. But to assure that each student would have an equivalent laboratory experience to students at other institutions, the laboratory experience was concentrated and was allotted a larger block of time than the traditional two-semester sequence would incorporate. Each week, students in CH 204 meet for 4 hours of wet laboratory, 1 hour of computer laboratory, and 1 hour discussion/lecture, thus providing them with 6 hours of instruction, comparable to 2 semesters of 3-hour laboratory courses that they might take at comparable institutions. Each section can be composed of as many as 21 students, although with some reconfiguration of the laboratory space, that number can be increased to 24 students. Students are not obligated to take the associated laboratory course along with the lecture course. Indeed, a very common practice for

students is to take CH 204 after they take the second half of General Chemistry, owing largely to the difficulty of scheduling laboratory courses since the availability of laboratory sections is so limited. As a consequence, very little carryover from the lecture content to the laboratory is expected; the laboratory is essentially a stand-alone course. This design of the General Chemistry curriculum at The University of Texas at Austin was beneficial to the purposes of this study in that a comparison between two laboratory curricula could be arranged without fear that students might be placed at a disadvantage in the General Chemistry lecture course.

#### **STEPS TOWARDS A NEW GENERAL CHEMISTRY LABORATORY COURSE**

As part of a periodic review of courses that were being taught in the Department, some consideration was given to developing another version of a General Chemistry laboratory course specifically for its largest audience, life science students. At that time a fairly conventional introductory laboratory course, numbered CH 204, had been designed, with “standard laboratory exercises” including an experiment designed to illustrate the scientific method, a one-period qualitative analysis experience, experiments on physical measurements of the density and specific heat of a solid, the vapor pressure of a salt solution, and the heat of neutralization, quantitative analyses using spectrophotometry, gravimetric analysis, acid-base titration, and redox titration, and explorations into paper chromatography, pH and buffers, and electrochemistry. The laboratory manual was created in-house and students purchased copies of it from The University’s duplicating office. In all of the laboratory exercises, the course made use of a locally designed device called the ChemBox, which allowed for rapid electronic collection of different kinds of analytical data simultaneously, *e.g.*, conductivity, light absorption, and potentials. The 4-hour wet laboratory session was used for the collection of data; the 1-hour computer laboratory session was used for quizzes related to the

upcoming laboratory and for electronic submission of results. Students worked individually on all aspects of instruction in the course and were evaluated from their preparation for the laboratory by writing out the procedure they would follow in their laboratory notebooks, their performance on the electronically delivered quizzes which were also electronically graded, and their experimental results, also submitted and graded electronically. Attendance at the 1-hour discussion/lecture period was voluntary, but it provided some insight on performing the upcoming experiment and the handling of data for the eventual report. It was against this structure that a new course was developed.

With the time structure imposed by the existing laboratory course, the beginnings of CH 204 AV (Alternate Version) were set in motion. In Fall 1997, Dr. Kent K. Stewart started working on some experiments and ideas for use in this new experimental course. This new course was designed around the observation that junior and senior level chemistry and biochemistry majors had little experience making quantitative measurements, and so the course was developed around the theme of quantitative measurements for life science systems. The course was also designed around the idea that students needed a practical experience; to meet this goal, modern instrumentation and the cognitive tools of the trade would be employed. Finally, the course also was intended to provide a more “enjoyable” General Chemistry laboratory experience than traditional laboratory courses; by focusing on chemistry relevant to the intended audience’s field of study, students were expected to find the experience more interesting. To choose how to structure the course, consideration was then given to the identity of the chemistry techniques that are common in life science laboratories, as established from discussions with life science faculty. A summary of these preferred techniques appear in Table 2.

Table 2: Common Chemistry Techniques Used in Life Science Laboratories

pH measurements	✓
Use of UV/Vis spectroscopy to:	
Identify compounds	✓
Determine analyte concentrations	✓
Use of colorimetric reactions	
Classical reactions	✓
Enzyme-catalyzed reactions	✓
Chromatography	
Gas chromatography (GC)	
Liquid chromatography (LC)	✓
Thin layer chromatography (TLC)	
Centrifugation	
Electrophoresis	
Enzyme Linked Immunosorbent Assays (ELISA)	
Micro-titer plate assays	

(✓) indicates the techniques that were chosen for CH 204 AV

The techniques that were chosen largely followed those common to standard General Chemistry laboratory courses and those available for beginning chemistry students. Certainly, pH measurements are very common for the “standard” General Chemistry laboratory experiments, and while spectroscopy is also common for General Chemistry laboratories, it is used more commonly for quantification but not for identification of compounds owing to the fact that complete spectra must be recorded and not many General Chemistry laboratories have a spectrophotometer suitable for that purpose available. The use of colorimetric reagents is also fairly common General Chemistry laboratory experience both in quantification, as in the classic copper-ammonia system, or for qualitative analysis, as using dimethylglyoxime to establish the presence of nickel (II) ions in solution. In CH 204 AV, we also employed enzymatic reagent systems for selectivity in complex solutions, particularly useful for life-science oriented samples. Of the chromatographic techniques, gas chromatography and thin layer chromatography

are commonly taught in Organic Chemistry laboratory, so only Liquid Chromatography, in the form of disposable reverse-phase columns, was chosen for CH 204 AV. The other techniques listed, centrifugation, electrophoresis, and ELISA, required substantial understanding in biochemistry and as such were not considered as the basis for viable experiences in CH 204 AV.

There was also a key element of the structure of the existing course that would eventually be modified for this new course. CH 204, like many laboratory courses, did not take advantage of the uniqueness of the laboratory environment, which encourages social interaction and all its subsequent benefits as defined by the Cognitive Apprenticeship Theory, *vide supra*. In traditional laboratory courses, a lecture model is imposed. Students work individually and focus is placed on finding the “correct” answer. Report submission is based primarily on the ease of evaluation by using data sheets. Little interaction is encouraged between students and it is often actively discouraged. This model of laboratory instruction is contrary to the way that science is actually done. Laboratory work in science naturally includes investigators working in cooperation with each other towards common goals, persons taking advantage of their unique skills and talents to address problems shared by the group, and the collegiality of a community of learners. With these observations in mind, and in the interest of recreating the research environment within the laboratory, student groups were created in CH 204 AV.

The new course then was constructed based upon the previously mentioned selection of techniques in such a way that the experiments increased in complexity and each drew from the students’ previous work. The course was taught for the first time in Spring 1998 to 17 students in one section with Dr. Stewart acting as the instructor of record and Michael J. Elliott, the author of this dissertation, acting as the Teaching Assistant. The Teaching Assistant’s role that semester was to make a working laboratory

experience out of the experiments that Dr. Stewart planned. Students were randomly assigned to groups of 2 or 3, so that 7 groups were created, on the first day of class; these groups persisted throughout the semester. Subsequent to that semester, in Fall 1998, the course expanded to 4 sections and 75 students who eventually finished the course. Further expansion of the course ensued, and 8 sections of the course were taught in spring semesters and 7 in fall semesters. In Spring 2001, the laboratory space was reconfigured so that 24 students could enroll in each section. With this change, 8 student groups of 2 or 3, rather than 7, were created in each section. Table 3 depicts the enrollment history, based on the number of students who completed the course, of CH 204 AV from its beginning in Spring 1998 through Spring 2001.

Table 3: Enrollment History of CH 204 AV

<u>Semester</u>	<u>Number of Sections</u>	<u>Number of Students</u>
Spring 1998	1	17
Fall 1998	4	75
Spring 1999	8	150
Fall 1999	7	135
Spring 2000	8	155
Fall 2000	7	139
Spring 2001	8	170

From the beginnings of CH 204 AV, the course was assigned a “head teaching assistant.” For semesters through Spring 2000, the head teaching assistant also taught some of the laboratory sections; the head teaching assistant also taught some of the lectures in the discussion/lecture period, although that responsibility fell primarily to the instructor of record. Beginning in Fall 2000, the head teaching assistant took on a larger administrative role and taught half of the lectures, ran the teaching assistant training sessions, and visited as many laboratory sessions as possible to assure that the laboratory

was running smoothly according to the precepts of the Cognitive Apprenticeship Theory. With these additional responsibilities, the head teaching assistant was relieved of teaching individual laboratory sections. The head teaching assistant also assured that all of the required chemicals were available and the instrumentation was operational for the course. This administrative structure was somewhat different than in the traditional CH 204 course; in CH 204, the head teaching assistant was responsible for lectures in the discussion/lecture period; the instructor of record was largely invisible to students. The instructor of record managed the computer systems that delivered and evaluated the electronic quizzes and helped resolve disputes in grading.

#### **APPLYING COGNITIVE APPRENTICESHIP THEORY TO THE NEW COURSE**

The CH 204 AV course began as an idea to design a General Chemistry laboratory course that would have the “feel” of a research laboratory. Undergraduate research has been and continues to be a very successful endeavor by many measures, and our goal for this new course was to *formalize* the research experience within the context of a standard laboratory course. To achieve this goal, we needed an educational model that described the beginnings of the research process. Cognitive Apprenticeship Theory (Chapter 1) is such a model and the new course was designed with this theory as a guide. This theory resembles traditional craft-type apprenticeship but is adapted for cognitive domains. One of the important features of the theory is the interaction between student and the expert and between students. This relationship is also expressed in chemistry research environments as well; it is the basis of graduate education. Hence we believed that Cognitive Apprenticeship Theory might act as a good model for laboratory work.

Within the Cognitive Apprenticeship model, there are six stages of instruction: Modeling, Coaching, Scaffolding/Fading, Articulation, Reflection, and Exploration. The process is meant to be sequential; by the time the student reaches Exploration, the student

should be ready to venture forth and complete a chemistry-related task on his/her own and be able to evaluate his/her own efforts towards that task. It seemed to us that one of the key goals of laboratory instruction is to be able to devise experiments and to analyze the results of these experiments. This goal describes the process that takes place when beginning students learn how to do research. The various activities within a suitably designed laboratory course could be fashioned into the stages of the Cognitive Apprenticeship model. Here are the stages of the theory, and how we attempted to implement them, in detail:

**MODELING.** In this beginning stage, the student observes the expert performing the tasks at hand. In the CH 204 AV laboratory, each teaching assistant demonstrated the day's tasks to the entire laboratory group at the beginning of the laboratory period. First, however, the teaching assistants themselves had to undergo training in how to operate all of the equipment and on what problems students typically encountered (based on our previous experience) during the coming laboratory session. The entire laboratory experience was structured so that only a small number of skills needed be presented in any one session, and the time the teaching assistants needed at the beginning of a laboratory session typically was only 10-15 minutes. On occasion, the students also received instruction during the formal 1-hour lecture associated with the course. However, since these lectures could be quite large (80-100 students), most of the "hands-on" instruction was done in each laboratory session, where the number of students was smaller (about 20), and most of the theory was developed in the formal lecture itself. By comparison, in the traditional laboratory CH 204, students also received instruction from the head teaching assistant during the discussion/lecture period and from their section's teaching assistant at the beginning of the laboratory period. The laboratory manual also included detailed procedural instructions.

**COACHING.** In the second stage, the expert provides feedback on student work. Once the students received their initial instruction, the teaching assistants moved around the laboratory, observing students as they started their work. Often for the first hour of a laboratory period, the students had to become oriented to the tasks they were doing, in effect figuring out what they needed to do. The teaching assistants were told that they should interact with as many student groups as they could, reminding and showing them the operation of the equipment or other tasks (some intellectual) that were important to the day's activity. One of the benefits of organizing students into groups was that the teaching assistants could interact with 7 or 8 groups, rather than 21 or 24 students, making their interaction with students more efficient. In the traditional CH 204 course, teaching assistants only assisted the students if students asked for help; less emphasis was placed on human interaction.

**SCAFFOLDING/ FADING.** In this stage, the expert provides support to the student for a period of time, then begins to remove those supports as the student becomes familiar with the task. Once the students knew how to operate the equipment and understood the details of the experiment they were doing that day, we advised the teaching assistants that they should observe the students and step in only when student groups appeared to be struggling. We advised the teaching assistants that they should allow time for the students to explore the task at hand and to intervene only if the students were performing a task improperly or in such a way that could be dangerous to themselves or other students. This stage requires some experience and some patience on the part of the teaching assistant acting as the expert; struggling with a problem is good for students, but too much struggle may lead to frustration. Finding the point in which it is beneficial to intervene takes some experience. In the traditional CH 204 course, little effort to interact

with students was made by teaching assistants, so this process would not have taken place.

**ARTICULATION.** In the articulation stage, the student explains his/ her knowledge, reasoning, and problem-solving strategies. In the CH 204 AV course, we used formal laboratory reports as a means for students to articulate their knowledge. The 12 laboratory exercises were grouped into 6 reports. Student groups prepared one report for submission; they were advised that they should work out amongst themselves how best to divide the labor in preparing the report. Each student within a group received the same score for the laboratory report. Another of the benefits of having 7 or 8 groups was that it reduced the amount of grading that a teaching assistant would have to take on since there were only 7 or 8 reports to grade. The reports were detailed and required substantial documentation of student work and analysis; the smaller number of reports allowed a higher level of expectation of analysis. The reports were structured (an outline was provided) and required students to address specific issues related to the laboratory exercises. Using the outline, we could probe the students' understanding of key issues. In the traditional CH 204 course, students submitted data online for their reports; these were done individually and were evaluated by the computer. Little emphasis was placed on analysis of the data, consistent with the character of verification-style laboratories; grades were assigned based on the "correctness" of their computations.

**REFLECTION.** In the fifth stage, students compare their knowledge with that of the expert. Again, we used laboratory reports as the device for one of the stages of instruction. Each laboratory report was evaluated by the teaching assistants, and feedback was provided from the teaching assistant to the students. Ordinarily evaluated reports were returned to students within a week of their submission. Students could then make revisions to the laboratory reports and resubmit them for a better grade.

However, they could not receive the maximum score upon resubmission. The point of the resubmission process was to have students reevaluate their work and improve it, and many students took advantage of this opportunity. The process also paralleled the submission of papers to peer-reviewed journals. In the traditional CH 204 laboratory, none of this process was included.

**EXPLORATION.** The final stage of the process is exploration, in which students themselves move into problem solving modes. We included a capstone laboratory experience, one in which students had to rely on their learned skills and develop details of a procedure. We asked students to determine the concentrations of sugar and two food dyes in a carbonated grape soda. One new skill had to be presented to the students, that of separation of the materials to be analyzed, however the details of the analysis were left to the students to work out. However, students had performed similar laboratory tasks earlier in the semester, so the general plan of attack was known to them. The exploration phase parallels chemical research and as such is important to our goal of illustrating the research process. In the traditional CH 204 course, the laboratory exercises were designed as stand-alone activities and did not include a capstone experience.

#### **STRUCTURE OF THE NEW COURSE**

The CH 204 AV course maintained the weekly 4-hour laboratory session, a 1-hour formal lecture session, and a 1-hour computer laboratory format of the standard CH 204 course, for the sake of scheduling. In the first few weeks of the course, an assignment, designed to teach students some of the computer skills they needed to complete their laboratory reports, was given to students to complete during the computer laboratory session. After this first assignment was completed, the computer laboratory was used solely for the purpose of assisting students in the preparation of their laboratory reports.

The formal lecture portion of the course was used to develop the theory behind the laboratory exercises the students were performing. Since the CH 204 AV course was not designed to demonstrate concepts presented in the lecture portion of the General Chemistry course, we found it necessary to describe the details of the chemistry that was being taught in the laboratory. We also used this portion of the course to give quizzes and exams.

The laboratory portion of the course involved 12 laboratory exercises. The general theme for the laboratory exercises was the measurement of concentrations of specific substances in biological systems. Several common methods of measurements were employed. The exercises were grouped into units based on similarities of concepts. The general scheme is presented below. The first unit, comprising the first three laboratory exercises, was focused on the basics of visible spectroscopy. Within this unit, the ideas that colored compounds had unique visible spectra and that the amount of light a solution absorbed was characteristic of the concentration of that solution were developed. In the third laboratory, several unknown samples were studied: the identity of some samples was unknown, and for others, the concentration was the unknown. Students were expected to develop their own procedures based on work from the first two experiments. The limitations on the use of these concepts were also discussed.

In the second unit, we explored the nature of acid and base solutions. The first of the three laboratories in this unit addressed the concept of pH. The pH of several buffer solutions and various common household mixtures was measured using a pH meter and long-range pH papers, and students made comparisons on the precision and accuracy of the two methods. Students also shared their data so that statistical treatments could be engaged. Several dyes and pH indicators were also placed in buffer solutions of different pH, and the effect of pH on their visible spectra was also observed, with student

commentary on the basis for any spectral change observed. The second and third laboratories in this unit addressed the use of titrations. For these experiments, a Mariotte flask titration system was employed. This system makes use of a Mariotte bottle, which has a narrow mouth at the top and a small outlet at the bottom. A narrow-diameter hollow glass tube, fitted with a stopper, is placed in the mouth of the bottle so that the mouth is sealed and air is only permitted in through the narrow-diameter tube. As long as the bottom of this tube is above the level of liquid in the Mariotte bottle, airflow is restricted and a constant flow of liquid can be obtained through the outlet. An illustration of the Mariotte titration system appears in Figure 1.

Figure 1: Mariotte Titration System

The second laboratory involved the titrations of many different acid solutions to observe the titration curve that resulted. These titration curves provide a qualitative

insight as to the strength of the acid and the number of ionizable protons in the acid molecule. The third laboratory involved the use of titrations to determine the concentration of acid in a solution. In effect, the acid/base unit provided the same kind of information using pH as a probe as does spectroscopy, namely, qualitative and quantitative information.

The third unit, which was composed of two laboratory exercises, addressed issues associated with selecting an analytical method appropriate to the sample to be analyzed. Not all analytes (compounds of interest within a sample) are colored, and so a colorimetric agent (a compound which will produce a colored species) is employed so that visible spectroscopy can be performed on such samples. Since these agents are typically colored themselves, the techniques and logic behind the subtraction of their contribution to the total absorbance of the sample are discussed. Students are expected to be able to develop a reaction scheme, based on general instructions for the method. In the second laboratory in this unit, two methods are presented to analyze samples; both will work, but each presents a unique set of analytical considerations as each method has a concentration range in which it will work. For the first time in the laboratory sequence, students have to use their previous knowledge to select the most appropriate method.

The fourth unit was a continuation of the ideas in the third; the two laboratories here focused on difficulties associated with the use of colorimetric reagents. Sometimes samples are inherently colored, although the analyte itself is colorless. In this case, care must be taken to determine absorbance ultimately due to the analyte once the colorimetric reagent is added. Both the colorimetric agent and the sample itself are colored and hence add to the total absorbance; these must be subtracted. In the second laboratory, method validation is addressed. The great difficulty with colorimetric analyses is that the analyst is dependent upon a reaction in order to observe the analyte. Some samples may react

with the colorimetric agent or otherwise hinder its effect; the wise analyst learns that he/she should confirm that this hindrance is not present. This process is described in detail, and students are again expected to create a protocol for their samples.

The fifth unit was a single laboratory exercise; it was designed to summarize the ideas and concepts in nearly all of the previous laboratory exercises. The sample to be analyzed is a carbonated grape soda which was analyzed for its dye and sugar (glucose) content. The two food dyes and the glucose in the sample were separated and analysis was made on all three. The food dyes' identities were confirmed and their concentrations determined. The glucose concentration was determined using a previously utilized method. In this exercise, students were expected to develop the bulk of their procedures which, however, were similar to those they had previously employed.

The sixth and final unit was also a single laboratory exercise. It described a different method for determining concentration, appropriate for enzyme (biological catalyst) systems and using reaction rates. Previous techniques were again employed; however, some new intellectual skills were presented.

A comparison of how the experimental course was structured relative to the existing control course follows in Table 4 on the following page.

Table 4: Comparison of the Structures of the Control and Experimental Courses

	<u>Control</u>	<u>Experimental</u>
Weekly Schedule	4 hours wet lab 1 hour computer lab 1 hour lab lecture	4 hours wet lab 1 hour computer lab 1 hour lab lecture
Nature of Wet Labs	“Standard” General Chemistry exercises, not related to each other	12 laboratory exercises in 6 units, sequentially presented
Nature of Computer Lab	Used for quizzes and electronic report submission	Used to develop necessary computer skills for report computations
Nature of Lab Lecture	Used to describe how to do the laboratory exercises and how to perform computations necessary to the report	Used to describe theory behind the laboratory exercises and some technical details and procedures
Lab Reports	Submitted electronically, grade primarily on obtaining the “correct” answer	Submitted on paper as formal reports, grade primarily on proper documentation of data and results
Quizzes	Weekly, electronically delivered and evaluated, in computer lab	Weekly, distributed on paper and hand-graded, in lab lecture
Tests	None	2 midterms, based on theory and typical computations
Final Exam	None	Based on theory and typical computations

## DATA COLLECTION

In Spring 1998, the first semester in which CH 204 AV was taught, an attitudinal survey was given to students enrolled in the course. This survey, and modifications of it, was then used to evaluate student reaction to CH 204 (the standard General Chemistry laboratory, as the control) and to the experimental course, CH 204 AV. The original survey, which was developed by the Learning through Evaluation, Adaptation, and Dissemination (LEAD) Center at the University of Wisconsin Madison<sup>49</sup> was employed for the first two semesters and was subsequently modified. Four variants of the survey were used during the Spring 1998 to Spring 2001 time period, these are presented as Appendices A, B, C, and D. The surveys employed during each semester are outlined in Table 5.

Table 5: Survey Form Used, per Semester

Semester	Survey Form Used
Spring 1998	Appendix A
Fall 1998	Appendix A
Spring 1999	Appendix B
Fall 1999	Appendix C
Spring 2000	Appendix C
Fall 2000	Appendix C
Spring 2001	Appendix D

Although the survey was modified, largely to shorten it in an effort to encourage participation, many of the core items of the original survey were retained. The common questions are renumbered (as New #) and are presented in Appendix E. These questions

are ultimately the ones that are analyzed. The original numbering on each version of the survey is also presented.

All but one of the questions that are in common across the four versions of the survey are assigned new numbers (as “New #”) for ease of comparison across semesters. The only common question excluded from this group is “Average hours each week spent on this course” because the set of possible responses changed over time. Aside from this one question, analyses are made upon this set of common questions.

The CH 204 AV course had been taught during every long (fall or spring) semesters since the Spring 1998 term. Early in the development of the CH 204 AV course, we focused on developing course content and structure; the number of sections was intentionally kept small. By Spring 1999, however, the course expanded to 8 sections and it kept this structure through Spring 2001. Little change to the structure of the course occurred over this time frame. As a consequence, merging data from one semester to the next over the Spring 1999 through Spring 2001 timeframe would not be unreasonable, if no other change was applied to the course.

Although we were able to make use of a survey that already existed, the original survey created at the University of Wisconsin-Madison does not appear to have been validated. Furthermore, as we shortened the original survey to suit our purposes, it is important to observe that this instrument, even if it had been validated, would have to be revalidated. However, even though the instrument has not been formally validated, it may be useful for understanding trends within the course. A discussion of how the survey was analyzed follows in the next chapter.

### **Chapter 3: Data Analysis**

The first semester in which the experimental course was taught was considered to be a pilot study in which the viability of teaching this new course to beginning chemistry students was investigated. As a result, the way in which the course was evaluated was different for the first semester than it was for subsequent semesters. A discussion of the first semester follows in the next section.

#### **SPRING 1998**

In the first semester that CH 204 AV was taught, nineteen (19) academically well-prepared students were specifically chosen by the Undergraduate Advising Office of the Department of Chemistry and Biochemistry for this new experimental course. Since these students were primarily Life Sciences majors (8 Biology and 6 Biochemistry), they were expected to have a natural interest in the subject matter of the new course. Of these 19 students, 17 eventually completed the course. Given the special experimental nature of this semester and the selection process for students for the course, no comparison to the control course CH 204 would be appropriate; however, data collected during this first semester indicated that students could be successful in this course and that the course should be taught to a larger audience.

#### **Survey Data**

The survey used in Spring 1998 asked the 17 successful students in the course to rate their confidence in their ability in science areas as well as their interest in various scientific areas before and after taking the chemistry laboratory course. Items were evaluated on a 0 (low) to 5 (high) scale and average ratings with their standard deviations are presented in the two tables, Table 6 and Table 7, below. Notable is that students reported a gain with respect to each item as a result of having been enrolled in CH

204AV. In some cases, the gain was dramatic. The original numbering of items on the survey, as shown in Appendix A, is presented here.

Table 6: Student Self-Reported Confidence in Ability, Spring 1998

Items	Statement	Before	After	Change
56,57	Understand Key Concepts of Chemistry	3.438 $\pm$ 1.031	4.706 $\pm$ 0.470	1.268
58,59	Solve Chemistry Problems	3.824 $\pm$ 0.809	4.588 $\pm$ 0.618	0.765
60,61	Understand the Chemistry Underlying Lab Experiments	2.059 $\pm$ 0.827	4.676 $\pm$ 0.466	2.618
62,63	Perform Lab Experiments	2.059 $\pm$ 1.029	4.647 $\pm$ 0.493	2.588
64,65	Visualize Key Concepts of Chemistry	2.882 $\pm$ 0.857	4.529 $\pm$ 0.717	1.647
66,67	Apply your Knowledge of Chemistry to the Real World	2.176 $\pm$ 0.883	4.765 $\pm$ 0.437	2.588
68,69	Understand Other Areas of Science	3.000 $\pm$ 0.612	4.176 $\pm$ 0.636	1.176
70, 71	Succeed in Another Chemistry Course	3.235 $\pm$ 0.903	4.471 $\pm$ 0.514	1.235
72,73	Succeed in a Chemistry-Related Discipline	2.882 $\pm$ 0.993	4.706 $\pm$ 0.470	1.824

Table 7 appears on the next page.

Table 7: Student Self-Reported Interest, Spring 1998

Items	Statement	Before	After	Change
74,75	Studying Chemistry in General	2.765 $\pm$ 1.562	4.353 $\pm$ 0.702	1.588
76,77	Taking More Chemistry	2.765 $\pm$ 1.437	4.176 $\pm$ 0.951	1.412
78,79	Pursuing a Chemistry-Related Major	2.529 $\pm$ 1.875	3.353 $\pm$ 1.693	0.824
80,81	Pursuing a Science-Related Field	4.176 $\pm$ 1.380	4.529 $\pm$ 1.281	0.353
82,83	Working with Others to Learn Science	3.412 $\pm$ 1.460	4.294 $\pm$ 0.772	0.882
84,85	Chemistry in Industry	1.412 $\pm$ 1.064	2.941 $\pm$ 1.560	1.529
86,87	Chemistry in Agriculture	1.471 $\pm$ 1.586	2.529 $\pm$ 1.736	1.059
88,89	Chemistry in Medicine	3.706 $\pm$ 1.490	4.882 $\pm$ 0.332	1.176
90,91	Chemistry in Athletics	1.882 $\pm$ 1.453	2.941 $\pm$ 1.391	1.059
92,93	Chemistry in the Environment	2.529 $\pm$ 1.586	3.706 $\pm$ 1.312	1.176
94,95	Science in General	4.235 $\pm$ 0.831	4.941 $\pm$ 0.243	0.706

In addition to the positive response to the course from the Confidence and Interest questions on the survey, students also responded overwhelmingly positively toward Question 113 on the survey, namely “Would you recommend this course to a friend?” A histogram of student responses is shown in Figure 2.

Figure 2: Histogram of “Would you recommend to a friend?” in Spring 1998

The survey result reflects a very positive impression of the course on the part of the students.

### Student Persistence

Although 2 of the original 19 students ultimately did not complete the course in Spring 1998, the remaining 17 did finish the course successfully which is defined as a passing grade, A, B, or C, as shown in Table 8.

Table 8: Spring 1998 Grades

	A	B	C	CR	D	F	Q	W	Students	% Success
Experimental	5	8	4	0	0	0	2	0	19	89.5%

This result suggested that beginning chemistry students would be able to understand and master the content of the new course.

## **Interviews**

Dr. Stewart asked students for commentary on the course and also asked two Biochemistry faculty members to review the course and to speak to students privately about the course. One of the students described the course as “rewarding” while one of the faculty members remarked that he had “never seen a group of students so enthusiastic about a course in my 13 years here” at The University of Texas at Austin. The combination of survey data, student interviews, and faculty reviews of the course indicated that the course was successful by the accepted measures of success. Consequently, the Department decided to offer the course again, but with an expansion to 4 sections, in Fall 1998.

## **OVERVIEW OF THE ANALYSIS FROM FALL 1998 THROUGH SPRING 2001**

Having taught the course for one semester, we believed that the new course was ready for comparison to the standard General Chemistry course offered by the University. For the evaluation of the laboratory courses, several factors were considered. These factors include:

1. The previously mentioned surveys, appearing as Appendices A, B, C and D, which were administered to students in both the standard laboratory courses (CH 204) which was the control and one experimental course (CH 204AV);
2. Drop and withdraw data for both laboratory courses;
3. Enrollment history in research courses subsequent to enrollment in both laboratory courses;
4. Data on retention in the sciences and Engineering for both laboratory courses.

Each of these factors are discussed in turn.

## **Survey Data**

The survey, as previously described, changed several times during the course of the experiment. The original survey, appearing as Appendix A, was perceived as being too long and was not readily completed by students. In addition, several items on the survey specifically asked questions about the instructional staff. These questions were removed for the next version of the survey, as well as questions that required a written response to “Other”.

Version B of the survey, appearing as Appendix B, was the first that was machine-scored in an effort to reach a larger number of students. One of the consequences of machine scoring was the need to change some of scales present in the original version of the survey: the answer scale on the original survey had to be adjusted to the scale available on the mark-sense forms. Some of the questions had evaluations of “0”, implying “Not Applicable”, while others had “0” implying “Low”. The mark sense forms in use by the Department of Chemistry and Biochemistry did not have a 0 as an option, so 0 “Not Applicable” was removed and other questions that had 0 “Low” were uniformly scaled from 1 (low) to 5 (high). Some of the original questions on Version A were scaled as high as 7, but all questions were rescaled to a maximum response value of 5, as the mark-sense forms in use did not allow a response larger than 5. Activity questions about “discussion/problem sessions” were changed to “computer lab” as the structure of both the control and experimental courses did not have a problem session but a weekly computer laboratory session instead. Version B also removed all items in reference to people (primarily, the instructional staff, but occasionally other students as well), a question about citizenship, and questions about Interest in Chemistry in Agriculture and Interest in Chemistry in Athletics. One new question was added: “The

organization of the labs was important for my learning.” This version of the survey was employed *only* in Spring 1999.

In an effort to further streamline the survey, Version C removed the original “Before” and “After” configuration for the Confidence in Ability and Interest items and only structured questions in the “After” Sense. Questions about “Materials” associated with the course were also removed. Four questions were added: one asking when students took the associated General Chemistry lecture course, two questions on the relationship to the lecture to the laboratory course, and one question probing student impression of the value of laboratory course. This version of the survey was in use for 3 semesters, from Fall 1999 through Fall 2000.

Version D, only in use for the last semester, rearranged the order of questions in Version C, and added four additional questions: one on student impression of taught laboratory skills and their relationship to student perceived goals and three questions about what resources were valuable towards success in the course.

In order to make comparisons between semesters, only those common questions which appeared in all versions of the survey are ultimately analyzed here, although the raw data for each of the items are presented for the reader’s convenience in the Appendices.

### **Drop and Withdraw Data**

In addition to the survey data, student add/drop data were collected for the experimental course and the control course in Summer 2005. Students may drop a course at The University of Texas at Austin without penalty until the twelfth class day. On the twelfth class day, course rosters become fixed. Students are permitted to drop courses from the thirteenth through the twentieth class day with approval from his/her dean; in this instance a “Q” (Drop) is recorded on the student’s grade report. Beyond the

twentieth class day until mid-semester, students may only withdraw from a class with permission of his/ her instructor, advisor, and dean. In these cases, either a “W” (Withdraw) or “WF” (Withdraw Failing) is assigned. No evaluation of “WF” was given to any student in either of the two courses at any time from Fall 1998 through Spring 2001. Data for each of the semesters under study is presented in subsequent sections of this chapter.

### **Longitudinal Studies**

One of the chief goals of laboratory instruction is to interest students in a science career. We hypothesized that if students became interested in a science career as a result of having been in a laboratory course, they would express this interest by:

1. doing research in an undergraduate research course later in their undergraduate career.
2. remaining in a science or engineering major.

To determine if these hypotheses were true, in Summer 2005 we obtained data on students in both the experimental and control courses. Since the overwhelming majority of students who took these courses should have graduated as of this writing, an analysis of the data would be instructive.

Not all of the students who finished the two courses in finished them successfully. Consequently, longitudinal studies are performed only on students who finished course with an A, B, C, or CR (Credit). Summaries of each of the semesters are presented in the relevant sections.

### **Enrollment in Research Courses**

The University of Texas at Austin offers research courses in many areas within the College of Natural Sciences. Given that the majority of students taking General Chemistry laboratories are Biology majors, it is reasonable to assume that these students

might pursue research in Biology or perhaps Chemistry. The numbers of students who enrolled in upper-division research courses in Biology and Chemistry are compiled and presented in the tables for each semester.

### **Retention in Science and Engineering Majors**

A reasonable question is if the successful students from the two courses remain in a science or engineering major. The College of Natural Sciences at The University of Texas at Austin offers Bachelor's degree programs in Chemistry and Biochemistry, Astronomy, Biology (including Botany, Zoology, Ecology, Microbiology, Nutrition, and Evolution), Computer Sciences, Geological Sciences, Mathematics, and Physics. Some students are also in the College of Natural Sciences and had not yet chosen a major at the time of their enrollment in General Chemistry laboratory. For purposes of this study, all of these majors are consolidated into "Science" majors. The College of Engineering offers concentrations in Aerospace, Architectural, Chemical, Civil, Electrical, Geosystems, Mechanical, and Petroleum Engineering. As in the case of the Natural Sciences, there are also students in the College of Engineering who had not yet chosen a major at the time of their enrollment in General Chemistry laboratory. All students within the College of Engineering are consolidated into "Engineering" majors. The enrollments on the twelfth class day, by college, of the students who successfully completed either the experimental or control course are outlined for each semester, in turn.

In addition, although the course was taught for six semesters beyond the time that the pilot study was performed, changes to the structure of the course took place over that time. Some of these changes were instituted by us, and some were imposed by a division of the University. The decision to offer the experimental course came so late in Fall 1998 that students were not advised of the change until classes started. As a consequence, a

reasonably random student distribution occurred between the control and experimental courses for that semester. Beyond that time, within the University's listing of course offerings, a statement that "Intended for Life Science majors" appeared with the experimental sections. In Fall 2000, in an effort to better understand how the instructor impacted the course, the head teaching assistant for the course acted as the course's instructor. In Spring 2000, one of the teaching assistants assigned to the experimental course also had an assignment in the control course. This fortuitous circumstance allows us to assess what impact the teaching assistant has, if any, on student impression of the laboratory course. Further, an at-risk student group was placed in the experimental course in Fall 2000 and Spring 2001. This group, as part of a project developed by the College of Natural Sciences called PENS (Partnership for Excellence in the Natural Sciences), was composed of primarily first-generation college students coming from high schools which were typically underrepresented at The University of Texas at Austin. These students took the same courses other Natural Sciences students took but in sections, intentionally kept small, unique to them. Additionally, these students received additional support from the College of Natural Sciences in the form of a tutor assigned to each class that was part of the program. The PENS group provides us an opportunity to evaluate the effectiveness of the experimental course on an at-risk student population. The changes in the course over time are summarized in Table 9, below.

Table 9: Variations of the Experimental Course from Fall 1998 to Spring 2001

<b>Term</b>	<b>Random Student Enrollment</b>	<b>Instructor</b>	<b>Teaching Assistant</b>	<b>PENS</b>
<b>Fall 1998</b>	Yes	Original	Unique to each course	No
<b>Spring 1999</b>	No	Original	Unique to each course	No
<b>Fall 1999</b>	No	Original	Unique to each course	No
<b>Spring 2000</b>	No	Original	One TA assigned to both courses, otherwise unique to each course	No
<b>Fall 2000</b>	No	Head TA	Unique to each course	Yes
<b>Spring 2001</b>	No	Original	Unique to each course	Yes

In order to better understand the impact of each of these variations on the laboratory courses, five analyses are performed.

1. A simple control versus experimental comparison for Fall 1998, which was the semester in which the student distribution is as random as it likely can be.

2. Control versus experimental comparison for Spring 1999, Fall 1999, Spring 2000, and Spring 2001, semesters in which the original instructor taught the experimental course. Students who are in special circumstances (the common teaching assistant or part of PENS) are excluded from this analysis.
3. Control versus experimental for students in the two sections in Spring 2000 which were taught by the common teaching assistant.
4. Control versus experimental for Fall 2000, the semester in which a different instructor taught the experimental course.
5. Experimental versus PENS in Fall 2000 and Spring 2001.

The analyses follow, in turn, over the course of the next several sections.

#### **FALL 1998**

The second semester that CH 204 AV was taught included an expansion of the number of sections that were offered. As part of this expansion, two teaching assistants handled the duties of instruction in the laboratory sections, and the instructor remained in charge of the associated laboratory lecture. As the Department's decision to allow the course to be taught came within a few days of the beginning of classes, 4 sections of the existing CH 204 laboratory were selected to be taught as CH 204AV. This fortunate circumstance assured a reasonably random distribution of students to be placed in the experimental and control courses, as students would not have been aware of the identity of the laboratory identity at the time of their registration. Survey data was collected from the 4 CH 204AV (experimental) sections and 4 sections of CH 204 (control) taught by experienced teaching assistants in the same time slots as the CH 204AV sections. Additionally, drop and withdraw, persistence in Science and Engineering majors, and future enrollment in research course data were collected in Summer 2005 on all sections

of the courses to assess immediate and longitudinal effects of the two courses on student enrollment patterns. These data are presented in the following sections.

### Survey Data

The survey used in Fall 1998, Version A, was the same used in Spring 1998. Forms were hand-marked by students and were later coded by the author of this dissertation. 48 surveys were obtained from the control group and 65 surveys were obtained from the experimental group. Different scales were used for different groups of questions; therefore, comparisons in the absolute scores between items may be misleading, but comparison of responses from the two student groups on the same survey item may be illustrative of a difference in student opinion. Presented here are the survey responses for the common questions, as defined in Appendix E. The complete set of survey responses, along with the original numbering, is presented in Appendix F. For items 10 through 24, a rating of “0” implies “Not Applicable” and as such, was not included in the average rating. These questions were scaled from 1 (negative) to 7 (positive). For the remaining questions, “0” implies “Strongly Disagree” and was included in the average rating. These were scaled from 0 (Strongly Disagree) to 5 (Strongly Agree). Average ratings are presented in Table 10 below.

Table 10: Common Questions from Survey for Control versus Experimental, Fall 1998

49	Eventually I understood the chemistry behind the labs.	$3.370 \pm 1.323$	$3.875 \pm 0.968$
50	The labs helped me understand important concepts in this course.	$3.043 \pm 1.429$	$3.723 \pm 1.023$
51	Enough time was allowed for labs.	$3.196 \pm 1.721$	$4.338 \pm 0.889$
<i>GENERAL QUESTION</i>			
52	Would you recommend this course to a friend?	$1.522 \pm 1.683$	$3.477 \pm 1.501$

A Multiple Analysis of Variance (MANOVA) is utilized, using the single independent variable "q1" (which is course identity) and each of the 43 questions "q10" through "q52" (following the common numbering scheme) as dependent variables. A MANOVA is chosen rather than running individual ANOVA (Analysis of Variance) tests for each dependent variable as one could reasonably assume that the dependent variables may be correlated to each other. Standard assumptions for MANOVA were considered, the ones of primary interest being: (1) the dependent variables should be quantitative, (2) data are drawn from a population which has normally distributed dependent variables, (3) in the population, the variance-covariance matrices for all cells are the same. In order to control the Type I error rate (finding significance through statistical tests when significance, in fact, does not exist), a Bonferroni correction was applied, so that the desired  $\alpha$  level of 0.05 was adjusted to  $0.05/43 = 0.00116$ . Failure to meet the assumption of homogeneity of covariances is not necessarily fatal to MANOVA, assuming that the samples were of similar size. Of the 113 surveys that were submitted, only 15 students in the control course and 52 in the experimental course completed all items within the survey. Uncompleted surveys were not analyzed.

With the described caveats, the overall MANOVA is shown in Table 11.

Table 11: Overall MANOVA on Survey Data, Fall 1998

**Multivariate Tests(b)**

Effect		Value	F	Hypothesis df	Error df	Sig.
Intercept	Pillai's Trace	.990	52.223(a)	43.000	23.000	.000

	Roy's Largest Root	3.667	1.961(a)	43.000	23.000	.043

a Exact statistic

b Design: Intercept+Q1

The null hypothesis is that there is no difference in how the two groups respond to the survey. An  $\alpha$  level is 0.05 is chosen, and since the observed significance, 0.00, is less than this value, the null hypothesis is rejected and we can conclude that the two groups responded differently to the survey. With an overall effect having been verified, the individual dependent variables can be checked, as shown in Table 12 beginning on the following page.

Table 12: MANOVA Survey Results, Fall 1998

The null hypothesis, in the case of each of the individual variables, is that there is no difference between the experimental and control groups. In no item on the survey is a significant difference found. There appears to be no difference between the two groups in terms of any of the variables we considered.

### Drop and Withdraw Data

In Summer 2005, final course grade information for the control and experimental courses was obtained from the registrar of The University of Texas at Austin. Of particular interest was the number of students that either dropped (with a grade of Q) or withdrew (with a grade of W) from the control and experimental courses under study. This information is summarized in Table 13.

Table 13: Drops and Withdraws, Fall 1998

	Q	W	Total Dropped	Students	% Dropped
<b>Control</b>	26	8	34	314	10.8%
<b>Experimental</b>	1	2	3	78	3.9%

The number of students who dropped the course either with a “Q” or “W” were combined and compared to the number of students officially registered in the course on

the twelfth class day. (Table 13) The percentage of students that dropped the control course is larger than for the experimental course in Fall 1998. To judge whether or not these observed differences are statistically significant, a  $\chi^2$  test is performed. Statistical significance is found at an  $\alpha$  level of 0.05. The null hypothesis is that there is no difference in the drop rates between the two courses; if a difference is found, it must be due to the alternative hypothesis, that the identity of the course does impact the drop rate. Using SPSS, we are able to determine the statistical significance of our drop results.

For Fall 1998, as shown in Table 14, a total of 392 students were enrolled in the experimental and control courses at the twelfth class day.

Table 14: Drop-Withdraw Cases, Fall 1998

Case Processing Summary						
	Cases					
	Valid		Missing		Total	
	N	Percent	N	Percent	N	Percent
Course * Total	392	100.0%	0	.0%	392	100.0%

Of these 392 students, 78 were enrolled in the experimental course and 314 were enrolled in the control course, as shown in Table 15.

Table 15: Drop – Withdraw Count, Fall 1998

Course * Total Crosstabulation				
Count		Total		Total
		Finished Course	Dropped or Withdrawn	
Course	Control	280	34	314
	Experimental	75	3	78
Total		355	37	392

A  $\chi^2$  analysis is then performed to determine statistical significance. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the drop and withdraw rate of the students in the experimental course as compared to that of students in the control course. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that the drop and withdraw rates between the two courses are different. The  $\chi^2$  analysis is shown in Table 16.

Table 16:  $\chi^2$  analysis on Drop – Withdraw Data, Fall 1998

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	3.563 <sup>b</sup>	1	.059		
Continuity Correction <sup>a</sup>	2.793	1	.095		
Likelihood Ratio	4.282	1	.039		
Fisher's Exact Test				.081	.039
Linear-by-Linear Association	3.554	1	.059		
N of Valid Cases	392				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 7.36.

According to the analysis, we fail to reject the null hypothesis as the observed significance (0.059 for the Pearson Chi-Square) exceeds the desired  $\alpha$  level of 0.05. Thus, students in Fall 1998 are not more likely to drop or withdraw from the control course than the experimental course.

### Longitudinal Studies

Longitudinal studies are best performed on students who completed the control and experimental courses successfully. Defining success as a final course grade of A, B, C, or CR, as described earlier, 265 of 314 students in the control group and 65 of 78

students in the experimental group were successful in Fall 1998. A breakdown of the grade distribution in Fall 1998 appears in Table 17.

Table 17: Final Course Grades, Fall 1998

	<b>A</b>	<b>B</b>	<b>C</b>	<b>CR</b>	<b>D</b>	<b>F</b>	<b>Q</b>	<b>W</b>	<b>Students</b>	<b>% Success</b>
<b>Control</b>	107	117	40	1	8	7	26	8	314	84.4%
<b>Experimental</b>	16	34	15	0	6	4	1	2	78	83.3%

It is on the group of successful students that the desired longitudinal studies are performed.

### Enrollment in Research Courses

Compiling information obtained from the registrar at The University of Texas at Austin, Table 18 shows the number of successful students who took research courses in Chemistry or Biology after having been enrolled in either the experimental or control course in Fall 1998.

Table 18: Biology and Chemistry Research Enrollment, Fall 1998

	<b>Took Biology or Chemistry Research</b>	<b>Did Not Take Biology or Chemistry Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	36	229	265	13.6%
<b>Experimental</b>	5	60	65	7.7%
<b>Total</b>	41	289	330	12.4%

A  $\chi^2$  analysis is then performed to determine if students from one of the two laboratory courses is more likely to enroll in Biology or Chemistry research courses. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the

number of students who subsequently enroll in Biology or Chemistry research courses in the experimental course as compared to students in the control course. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that students in one course enroll more frequently in subsequent Biology or Chemistry research courses than students in the other course. A summary of the enrollment information is found in Table 19.

Table 19: Biology and Chemistry Research Course Enrollment, Fall 1998

Course * ChemBio Crosstabulation				
Count		ChemBio		Total
		Did Not Take Chem or Bio Upper Div Research	Took Chem or Bio Upper Div Research	
Course	Control	229	36	265
	Experimental	60	5	65
Total		289	41	330

To determine statistical significance, a  $\chi^2$  analysis is performed and shown in Table 20.

Table 20:  $\chi^2$  analysis on Biology and Chemistry Research Course Enrollment, Fall 1998

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	1.666 <sup>b</sup>	1	.197		
Continuity Correction <sup>a</sup>	1.168	1	.280		
Likelihood Ratio	1.840	1	.175		
Fisher's Exact Test				.293	.138
Linear-by-Linear Association	1.661	1	.198		
N of Valid Cases	330				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 8.08.

Based on the observed significance, we fail to reject the null hypothesis and conclude that students in the two courses are equally likely to enroll in Biology or Chemistry research courses subsequent to their having successfully completed their General Chemistry laboratory.

Broadening the research course selection to any upper division research course within the realm of the College of Natural Sciences, Table 21 focuses on Fall 1998.

Table 21: Natural Sciences Research Enrollment, Fall 1998

	Took Upper Division Research	Did Not Take Upper Division Research	Successful Students	% Taking Research
<b>Control</b>	41	224	265	15.5%
<b>Experimental</b>	8	57	65	12.3%
<b>Total</b>	49	281	330	14.8%

A  $\chi^2$  analysis is then performed to determine if one group of students is more likely to participate in an upper division Natural Sciences research course. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the number of students who subsequently enroll in upper division Natural Sciences research courses in the experimental course as compared to students in the control course. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that students in one course enroll more frequently in subsequent upper division Natural Sciences research courses than students in the other course. A summary of the enrollment information is found in Table 22.

Table 22: Upper Division Natural Sciences Research Course Enrollment, Fall 1998

**Course \* AllUpperDiv Crosstabulation**

Count		AllUpperDiv		Total
		Did Not Take an Upper Div Research Course	Took an Upper Div Research Course	
Course	Control	224	41	265
	Experimental	57	8	65
Total		281	49	330

The  $\chi^2$  analysis is shown in Table 23.

Table 23:  $\chi^2$  analysis on Upper Division Natural Sciences Research Course Enrollment, Fall 1998

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	.413 <sup>b</sup>	1	.520		
Continuity Correction <sup>a</sup>	.201	1	.654		
Likelihood Ratio	.430	1	.512		
Fisher's Exact Test				.697	.336
Linear-by-Linear Association	.412	1	.521		
N of Valid Cases	330				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 9.65.

As in the case of considering only Biology and Chemistry research, we fail to reject the null hypothesis as the observed significance of 0.520 for the Pearson Chi-Square exceeds the desired  $\alpha$  level of 0.05. We conclude that students in the two courses are equally likely to enroll in upper division Natural Sciences research courses subsequent to their having successfully completed their General Chemistry laboratory.

### Retention in Science and Engineering Majors

A reasonable question is if the 330 successful students in Fall 1998 remain in a science or engineering major. Defining science and engineering majors as before, the enrollment on the twelfth class day, by college, of the students who successfully completed either the experimental or control course in Fall 1998 is outlined in Table 24.

Table 24: Enrollment by College, Fall 1998

	<b>Control</b>	<b>Experimental</b>	<b>Total</b>
<b>Architecture</b>	1	0	1
<b>Business</b>	5	1	6
<b>Communication</b>	2	1	3
<b>Education</b>	7	1	8
<b>Engineering</b>	31	9	40
<b>Fine Arts</b>	3	2	5
<b>Liberal Arts</b>	40	2	42
<b>Natural Sciences</b>	176	49	225
<b>Nursing</b>	0	0	0
<b>Pharmacy</b>	0	0	0
<b>Social Work</b>	0	0	0
<b>Total</b>	265	65	330

As Table 24 shows, in Fall 1998, 225 (68.2%) of the 330 successful students in the experimental and control courses were in the College of Natural Sciences at the beginning of their laboratory experience. An additional 40 (12.1%) were in the College of Engineering. In sum, 265 (80.3%) of the students in the two courses were represented by these two colleges. It is this combination of students that are of special interest for this study. Most of these students remained as Science or Engineering majors, although some eventually became Pharmacy majors. Since Pharmacy is related to both Biology and Chemistry, and since students cannot enter The University as first-year Pharmacy majors but rather transfer into the school after having taken two years of pre-professional

coursework, these students are also considered as having been retained, but as Pharmacy majors. Table 25 shows the number of students who began as Natural Science majors and who were retained as Natural Science, Engineering, or Pharmacy majors in Fall 1998 for both the experimental and control courses.

Table 25: Natural Sciences Retention, Fall 1998

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Control</b>	176	129	3	6	138	78.4%
<b>Experimental</b>	49	31	2	2	35	71.4%

Likewise, Table 26 shows retention data for Engineering majors in Fall 1998.

Table 26: Engineering Retention, Fall 1998

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Control</b>	31	7	22	0	29	93.5%
<b>Experimental</b>	9	2	7	0	9	100%

In sum, 79.6% of successful students are retained as Science and Engineering majors, as shown in Table 27.

Table 27: Total Natural Sciences and Engineering Retention, Fall 1998

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Control</b>	207	136	25	6	167	80.7%
<b>Experimental</b>	58	33	9	2	44	75.9%
<b>Total</b>	265	169	34	8	211	79.6%

A  $\chi^2$  analysis is then performed to determine if students in one group are more likely to be retained as Science or Engineering majors. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the retention rate as Science, Engineering, and Pharmacy majors for students in the experimental course as compared to the retention rate of the students in the control course. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that there is a difference in the retention rates between the students in the two courses. A summary of the retention data is found in Table 28.

Table 28: Summary of Retention Data, Fall 1998

Course * Retention Crosstabulation				
Count		Retention		Total
		Not Retained	Retained	
Course	Control	40	167	207
	Experimental	14	44	58
Total		54	211	265

The  $\chi^2$  analysis on the retention data is shown in Table 29.

Table 29:  $\chi^2$  analysis on Retention Data, Fall 1998

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	.647 <sup>b</sup>	1	.421		
Continuity Correction <sup>a</sup>	.384	1	.535		
Likelihood Ratio	.628	1	.428		
Fisher's Exact Test				.461	.264
Linear-by-Linear Association	.645	1	.422		
N of Valid Cases	265				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 11.82.

Based on the observed significance of 0.421 for the Pearson Chi-Square, we fail to reject the null hypothesis and conclude that students in the two courses are equally likely to be retained as Natural Sciences, Engineering, or Pharmacy majors.

#### **CONTROL VERSUS EXPERIMENTAL FOR SPRING 1999, FALL 1999, SPRING 2000, AND SPRING 2001**

In these semesters in which the experimental course CH 204 AV was offered, students could elect to take this course by either observing that the catalog description of the course included the line “Intended for Life Science majors” and was listed as being taught by Dr. Stewart, the original instructor of the course. As a consequence, the students in the experimental group may be somewhat self-selected. For all of the Spring semesters within this grouping, 8 sections were taught; this arrangement necessitated the use of several teaching assistants. In Spring 1999 and Spring 2000, the head teaching assistant taught individual laboratory sections as one of the 4 assigned teaching assistants. The arrangement in Fall 1999 was similar, but only 7 sections of the experimental course

were offered. In Spring 2001, the head teaching assistant's duties were modified away from teaching individual laboratory sections and towards a more administrative role of teaching some of the lecture sections and supervising other teaching assistants. The same data collected for Fall 1998 was also collected for the laboratory courses taught during this time period.

### Survey Data

Survey data collected over the four semesters under study are compiled and organized in Table 30. These data reflect the merger of all data using the common numbering scheme. Surveys from students in special circumstances (specifically, those in the two sections with the common TA in Spring 2000 and PENS students in Spring 2001) are excluded from this analysis. Data for individual semesters can be found in Appendices G (Spring 1999), H (Fall 1999), I (Spring 2000) and K (Spring 2001).

As in Fall 1998, a Multiple Analysis of Variance (MANOVA) is utilized, using the single independent variable "q1" (which is course identity) and each of the 43 questions "q10" through "q52" (following the common numbering scheme) as dependent variables. Standard assumptions for MANOVA were considered, the ones of primary interest being: (1) the dependent variables should be quantitative, (2) data are drawn from a population which has normally distributed dependent variables, (3) in the population, the variance-covariance matrices for all cells are the same. In order to control the Type I error (finding significance through statistical tests when significance, in fact, does not exist) rate, a Bonferroni correction was applied, so that the desired  $\alpha$  level of 0.05 was adjusted to  $0.05/43 = 0.00116$ .

For the survey data, the homogeneity of covariance assumption was checked with Box's M Test (Table 31). One of the important assumptions of MANOVA is that the covariance matrices across groups are equal. The null hypothesis is that there is no difference in the observed covariance matrices. An  $\alpha$  level of 0.05 is chosen. Should the observed significance be less than 0.05, the null hypothesis must be rejected in favor of the alternative hypothesis, which is that the covariance matrices between the two groups are different.

Table 31: Box's Test on Survey Data, Control versus Experimental

**Box's Test of Equality of Covariance Matrices<sup>a</sup>**

Box's M	1653.488
F	1.663
df1	946
df2	2341664
Sig.	.000

Tests the null hypothesis that the observed covariance matrices of the dependent variables are equal across groups.

a. Design: Intercept+q1

As the observed significance is less than 0.05 (Table 31), the null hypothesis in this case is rejected and it is appropriate to conclude that the observed covariance matrices among groups are different. An inspection of Levene's Test in Table 32 sheds insight on the source of the difficulty.

q52	.192	1	915	.662

Tests the null hypothesis that the error variance of the dependent variable is equal across groups.

a. Design: Intercept+q1

Levene's Test is used to assess the assumption that the error variance of the dependent variable is equal across groups. The null hypothesis is that there is no difference in the error variances. If an  $\alpha$  level of 0.05 is chosen, in several cases, the null hypothesis should be rejected in favor of the alternative hypothesis, which is that the error variances are indeed different. In the case of these variables, the responses of the students are very skewed.

The failure of these two tests indicates that any conclusion should be approached with some caution. The observed significance of 0.000 in Box's M Test implies strong significance, which could cause a great deal of concern. Failure to meet the assumption of homogeneity of covariances is not necessarily fatal to MANOVA, assuming that the samples were of similar size. Of the 1087 surveys that were submitted over the course of these four semesters, 503 students in the control course and 414 in the experimental course completed all items within the survey. Uncompleted surveys were not analyzed.

With the described caveats, the overall MANOVA is shown in Table 33. Significance, as measured as an  $\alpha$  level less than 0.05, suggests that the students in the two groups respond differently to the survey.

Table 33: Overall MANOVA on Survey Data for Control versus Experimental

Multivariate Tests <sup>b</sup>						
Effect		Value	F	Hypothesis df	Error df	Sig.

	Hotelling's Trace	1.121	22.753 <sup>a</sup>	43.000	873.000	.000
	Roy's Largest Root	1.121	22.753 <sup>a</sup>	43.000	873.000	.000

a. Exact statistic

b. Design: Intercept+q1

The observed significance is indeed less than 0.05, implying that there are survey items on which students in the two groups responded differently. A question by question analysis follows. Using the Bonferroni correction, as previously described, implies that a calculated significance of less than 0.00116 represents a difference between the two student groups.

Table 34: MANOVA Survey Results, Control versus Experimental

The survey demonstrates differences on most questions except q10, q15, q20, q31, q35, q36, q37, q38, q39, q41, q42, q43, and q44. Notably, q10, q15, and q20 address the impact of learning, impact on confidence, and impact on enthusiasm (respectively) of the lecture component of the laboratory course. Two other questions in this group, q43 and q44, also addressed the laboratory lecture as well. Of the remaining questions in which no difference was found between the two groups, all but one (q31) address student interest with respect to some aspect of science. Indeed, of the nine “interest” questions, only in 2 is a significant difference found: studying chemistry in general (q34) and chemistry in medicine (q40). Within the group of confidence questions, in all but one (q31, understand areas of science) a significant difference is found.

Although many of the survey items display a difference in opinion between the two student groups, a particularly dramatic result occurs with q52, “Would you recommend this course to a friend?” Figure 3 on the next page demonstrates student response to this question.

Figure 3: Histogram of “Would you recommend this course to a friend?”, Control versus Experimental

### Drop and Withdraw Data

As is the case for Fall 1998, final course grade information for the control and experimental courses was obtained from the registrar of The University of Texas at Austin for all of the semesters under study. Of particular interest was the number of students that either dropped (with a grade of Q) or withdrew (with a grade of W) from the two courses under study. For Spring 1999, this information is summarized in Table 35.

Table 35: Drops and Withdraws, Spring 1999

	<b>Q</b>	<b>W</b>	<b>Total Dropped</b>	<b>Students</b>	<b>% Dropped</b>
<b>Control</b>	34	7	41	427	9.6%
<b>Experimental</b>	4	4	8	157	5.1%

In Fall 1999, a smaller number of sections of both the control and experimental courses were offered. This reduction is reflected in the number of students who dropped and withdrew from the two courses, as described by Table 36.

Table 36: Drops and Withdraws, Fall 1999

	<b>Q</b>	<b>W</b>	<b>Total Dropped</b>	<b>Students</b>	<b>% Dropped</b>
<b>Control</b>	21	7	28	261	10.7%
<b>Experimental</b>	9	1	10	144	6.9%

The student groups in Spring 2000 were further subdivided in that one section of the control course and one section of the experimental course were taught by the same teaching assistant (TA). Hence, the tally of students who either dropped or withdrew from the two courses is kept separate for those two sections from the other sections in which the courses were taught. For those students in the sections were not taught by the common TA, the number of students who either dropped or withdrew from the control and experimental courses is shown in Table 37.

Table 37: Drops and Withdraws, Spring 2000

		<b>Q</b>	<b>W</b>	<b>Total Dropped</b>	<b>Students</b>	<b>% Dropped</b>
<b>Without Common TA</b>	<b>Control</b>	36	6	42	454	9.3%
	<b>Experimental</b>	1	2	3	138	2.2%
<b>With Common TA</b>	<b>Control</b>	0	0	0	20	0%
	<b>Experimental</b>	0	0	0	20	0%

Notably, and following the pattern observed in previous semesters, the number of students who dropped the course with either a “Q” or “W” is higher in the control group than it is in the experimental group. No student in either of the sections taught by the common TA dropped or withdrew from either of the two courses.

Finally, in Spring 2001, two sections of the PENS group joined traditional control and experimental groups. The PENS students are analyzed later, but their drop and withdraw data are shown in Table 38, along with the drop and withdraw data for the control and experimental groups.

Table 38: Drops and Withdraws, Spring 2001

	<b>Q</b>	<b>W</b>	<b>Total Dropped</b>	<b>Students</b>	<b>% Dropped</b>
<b>Control</b>	26	5	31	479	6.5%
<b>Experimental</b>	5	2	7	135	5.2%
<b>PENS</b>	0	1	1	41	2.4%

Combining the numbers for these four semesters, we find, in Table 39, the total number of drops and withdraws for the control and experimental groups.

Table 39: Total Drops and Withdraws for Control versus Experimental Comparison

	<b>Q</b>	<b>W</b>	<b>Total Dropped</b>	<b>Students</b>	<b>% Dropped</b>
<b>Control</b>	117	25	142	1621	8.7%
<b>Experimental</b>	19	9	28	574	4.9%

The number of students who dropped the course either with a “Q” or “W” were combined and compared to the number of students officially registered in the course on the twelfth class day. (Table 39) As in Fall 1998, the percentage of students that dropped the control course is larger than for the experimental course during this time period. To judge whether or not these observed differences are statistically significant, a  $\chi^2$  test is performed. Statistical significance is found at an  $\alpha$  level of 0.05. The null hypothesis is that there is no difference in the drop rates between the two courses; if a difference is found, it must be due to the alternative hypothesis, that the identity of the course does impact the drop rate. Using SPSS, we are able to determine the statistical significance of our drop results.

Saving the analysis of the PENS students for later, for the control versus experimental comparison, as shown in Table 40, a total of 2195 students were enrolled in the experimental and control courses at the twelfth class day over the four semesters under study.

Table 40: Drop-Withdraw Cases, Control versus Experimental

<b>Case Processing Summary</b>						
	Cases					
	Valid		Missing		Total	
	N	Percent	N	Percent	N	Percent
Course * Total	2195	100.0%	0	.0%	2195	100.0%

Of these 2195 students, 574 were enrolled in the experimental course and 1621 were enrolled in the control course, as shown in Table 41.

Table 41: Drop – Withdraw Count, Control versus Experimental

Course * Total Crosstabulation				
Count		Total		Total
		Finished Course	Dropped or Withdrawn	
Course	Control	1479	142	1621
	Experimental	546	28	574
Total		2025	170	2195

A  $\chi^2$  analysis is then performed to determine statistical significance. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the drop and withdraw rate of the students in the experimental course as compared to that of students in the control course. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that the drop and withdraw rates between the two courses are different. The  $\chi^2$  analysis is shown in Table 42.

Table 42:  $\chi^2$  analysis on Drop – Withdraw Data, Control versus Experimental

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	8.940 <sup>b</sup>	1	.003	.003	.001
Continuity Correction <sup>a</sup>	8.405	1	.004		
Likelihood Ratio	9.779	1	.002		
Fisher's Exact Test					
Linear-by-Linear Association	8.936	1	.003		
N of Valid Cases	2195				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 44.46.

According to the analysis, we must reject the null hypothesis as the observed significance (0.003 for the Pearson Chi-Square) is less than the desired  $\alpha$  level of 0.05. Instead, the alternative hypothesis must be true, that students in the control course are more likely to drop or withdraw than students in the experimental course.

### Longitudinal Studies

Longitudinal studies are best performed on students who completed the control and experimental courses successfully. Defining success as a final course grade of A, B, C, or CR, as described earlier, 352 of 427 students in the control group and 144 of 157 students in the experimental group were successful in Spring 1999. A breakdown of the grade distribution in Spring 1999 appears in Table 43.

Table 43: Final Course Grades, Spring 1999

	<b>A</b>	<b>B</b>	<b>C</b>	<b>CR</b>	<b>D</b>	<b>F</b>	<b>Q</b>	<b>W</b>	<b>Students</b>	<b>% Success</b>
<b>Control</b>	173	109	68	2	21	13	34	7	427	82.4%
<b>Experimental</b>	56	70	18	0	2	3	4	4	157	91.7%

The pattern of a larger number of students in the experimental group being successful is repeated in Fall 1999, as depicted in Table 44.

Table 44: Final Course Grades, Fall 1999

	<b>A</b>	<b>B</b>	<b>C</b>	<b>CR</b>	<b>D</b>	<b>F</b>	<b>Q</b>	<b>W</b>	<b>Students</b>	<b>% Success</b>
<b>Control</b>	88	50	65	2	11	17	21	7	261	78.5%
<b>Experimental</b>	46	63	21	0	2	2	9	1	144	90.3%

In Spring 2000, four student groups exist, two each of control and experimental. Only those sections without the common teaching assistant are analyzed for now. The final grade information is shown in Table 45.

Table 45: Final Course Grades for Sections without the Common TA, Spring 2000

	<b>A</b>	<b>B</b>	<b>C</b>	<b>CR</b>	<b>D</b>	<b>F</b>	<b>Q</b>	<b>W</b>	<b>Students</b>	<b>% Success</b>
<b>Control</b>	126	194	66	1	14	11	36	6	454	85.2%
<b>Experimental</b>	81	47	5	0	1	1	1	2	138	96.4%

The last semester in which a comparison between control and experimental groups is done is Spring 2001. In this semester, the PENS group is also present. The analysis of the PENS group is performed later in this dissertation. The relevant grade information is presented in Table 46.

Table 46: Final Course Grades, Spring 2001

	<b>A</b>	<b>B</b>	<b>C</b>	<b>CR</b>	<b>D</b>	<b>F</b>	<b>Q</b>	<b>W</b>	<b>Students</b>	<b>% Success</b>
<b>Control</b>	142	165	97	1	29	14	26	5	479	84.6%
<b>Experimental</b>	56	50	16	0	4	2	5	2	135	90.4%

Summing the four semesters under study, and focusing strictly on the control and experimental groups, we find that 1349 (83.2%) of the 1621 control students received an A, B, C, or CR (Credit) in their laboratory course and are deemed successful. By contrast, 529 (92.2%) of the students in the experimental course are ultimately successful

in their laboratory course. It is on the group of 1878 successful students that the desired longitudinal studies are performed. The summed data appear in Table 47.

Table 47: Final Course Grades, Control versus Experimental

	<b>A</b>	<b>B</b>	<b>C</b>	<b>CR</b>	<b>D</b>	<b>F</b>	<b>Q</b>	<b>W</b>	<b>Students</b>	<b>% Success</b>
<b>Control</b>	529	518	296	6	75	55	117	25	1621	83.2%
<b>Experimental</b>	239	230	60	0	9	8	19	9	574	92.2%

### Enrollment in Research Courses

Compiling information obtained from the registrar at The University of Texas at Austin, Table 48 shows the number of successful students who took research courses in Chemistry or Biology after having been enrolled in either the experimental or control course in Spring 1999.

Table 48: Biology and Chemistry Research Enrollment, Spring 1999

	<b>Took Biology or Chemistry Research</b>	<b>Did Not Take Biology or Chemistry Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	49	303	352	13.9%
<b>Experimental</b>	29	115	144	20.1%
<b>Total</b>	78	418	496	15.7%

For Fall 1999, as in Spring 1999, a larger proportion of the experimental students pursued upper division research courses in Biology and Chemistry. Data are tabulated in Table 49.

Table 49: Biology and Chemistry Research Enrollment, Fall 1999

	<b>Took Biology or Chemistry Research</b>	<b>Did Not Take Biology or Chemistry Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	28	177	387	13.7%
<b>Experimental</b>	22	108	133	16.9%
<b>Total</b>	50	285	335	14.9%

In Spring 2000, the previous pattern is reversed. Considering only the students in sections without the common TA, a larger percentage of students in the control group took research courses in Biology or Chemistry. The data are presented in Table 50.

Table 50: Biology and Chemistry Research Enrollment for Sections without the Common TA, Spring 2000

	<b>Took Biology or Chemistry Research</b>	<b>Did Not Take Biology or Chemistry Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	52	335	387	13.4%
<b>Experimental</b>	14	119	133	10.5%
<b>Total</b>	66	454	520	12.7%

Finally, in Spring 2001, the percentages of students pursuing upper division research in Chemistry and Biology are roughly the same between the control and experimental groups. These data are shown in Table 51.

Table 51: Biology and Chemistry Research Enrollment, Spring 2001

	<b>Took Biology or Chemistry Research</b>	<b>Did Not Take Biology or Chemistry Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	52	353	405	12.8%
<b>Experimental</b>	16	106	122	13.1%
<b>Total</b>	68	459	527	12.9%

A consolidation of these results is displayed in Table 52.

Table 52: Biology and Chemistry Research Enrollment for Control versus Experimental

	<b>Took Biology or Chemistry Research</b>	<b>Did Not Take Biology or Chemistry Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	181	1168	1349	13.4%
<b>Experimental</b>	81	448	529	15.3%
<b>Total</b>	262	1616	1878	14.0%

A  $\chi^2$  analysis is then performed to determine if students from one of the two laboratory courses is more likely to enroll in Biology or Chemistry research courses. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the number of students who subsequently enroll in Biology or Chemistry research courses in the experimental course as compared to students in the control course. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that students in one course enroll more frequently in subsequent

Biology or Chemistry research courses than students in the other course. A summary of the enrollment information is found in Table 53.

Table 53: Biology and Chemistry Research Course Enrollment, Control versus Experimental

Course * ChemBio Crosstabulation				
Count		ChemBio		Total
		Did Not Take Chem or Bio Upper Div Research	Took Chem or Bio Upper Div Research	
Course	Control	1168	181	1349
	Experimental	448	81	529
Total		1616	262	1878

To determine statistical significance, a  $\chi^2$  analysis is performed and shown in Table 54.

Table 54:  $\chi^2$  analysis on Biology and Chemistry Research Course Enrollment, Control versus Experimental

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	1.136 <sup>b</sup>	1	.286	.300	.161
Continuity Correction <sup>a</sup>	.984	1	.321		
Likelihood Ratio	1.118	1	.290		
Fisher's Exact Test					
Linear-by-Linear Association	1.136	1	.287		
N of Valid Cases	1878				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 73.80.

Based on the observed significance, we fail to reject the null hypothesis and conclude that students in the two courses are equally likely to enroll in Biology or

Chemistry research courses subsequent to their having successfully completed their General Chemistry laboratory.

Broadening the research course selection to any upper division research course within the realm of the College of Natural Sciences, Table 55 focuses on Spring 1999.

Table 55: Upper Division Research Enrollment for Control versus Experimental, Spring 1999

	<b>Took Upper Division Research</b>	<b>Did Not Take Upper Division Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	59	293	352	16.8%
<b>Experimental</b>	31	113	144	21.5%
<b>Total</b>	90	406	496	18.2%

Fall 1999 displays the same pattern in that a larger percentage of students in the experimental group took an upper division research course within the College of Natural Sciences. The data are presented in Table 56.

Table 56: Upper Division Research Enrollment for Control versus Experimental, Fall 1999

	<b>Took Upper Division Research</b>	<b>Did Not Take Upper Division Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	32	173	205	15.6%
<b>Experimental</b>	22	108	130	16.9%
<b>Total</b>	54	281	335	16.1%

The Natural Sciences upper division research result parallels that of only chemistry and biochemistry in Spring 2000 in that a larger number of students in the control group took a subsequent research course. Only data corresponding to students who did not have the common TA are shown in Table 57.

Table 57: Upper Division Research Enrollment for Control versus Experimental, Spring 2000

	<b>Took Upper Division Research</b>	<b>Did Not Take Upper Division Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	64	323	387	16.5%
<b>Experimental</b>	15	118	133	11.3%
<b>Total</b>	79	441	520	15.2%

Similar percentages of students took upper division research courses in Spring 2001, as shown in Table 58. Only students in the control and experimental groups are displayed here.

Table 58: Upper Division Research Enrollment for Control versus Experimental, Spring 2001

	<b>Took Upper Division Research</b>	<b>Did Not Take Upper Division Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	66	339	405	16.3%
<b>Experimental</b>	19	103	122	15.6%
<b>Total</b>	85	442	527	16.1%

The combination of all of the semesters under study is shown in Table 59.

Table 59: Natural Sciences Research Enrollment for Control versus Experimental

	<b>Took Upper Division Research</b>	<b>Did Not Take Upper Division Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	221	1128	1349	16.4%
<b>Experimental</b>	87	442	529	16.4%
<b>Total</b>	308	1570	1878	16.4%

The summation provides the astonishing result that 16.4% of students in both groups took an upper division research course subsequent to their introductory chemistry laboratory experience. Still, in the interest of establishing the relationship, a  $\chi^2$  analysis is performed to determine if one group of students is more likely to participate in an upper division Natural Sciences research course. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the number of students who subsequently enroll in upper division Natural Sciences research courses in the experimental course as compared to students in the control course. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that students in one course enroll more frequently in subsequent upper division Natural Sciences research courses than students in the other course. A summary of the enrollment information is found in Table 60.

Table 60: Upper Division Natural Sciences Research Course Enrollment for Control versus Experimental

Course * AllUpperDiv Crosstabulation				
Count		AllUpperDiv		Total
		Did Not Take an Upper Div Research Course	Took an Upper Div Research Course	
Course	Control	1128	221	1349
	Experimental	442	87	529
Total		1570	308	1878

The  $\chi^2$  analysis is shown in Table 61.

Table 61:  $\chi^2$  analysis on Upper Division Natural Sciences Research Course Enrollment for Control versus Experimental

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	.001 <sup>b</sup>	1	.973	1.000	.512
Continuity Correction <sup>a</sup>	.000	1	1.000		
Likelihood Ratio	.001	1	.973		
Fisher's Exact Test					
Linear-by-Linear Association	.001	1	.973		
N of Valid Cases	1878				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 86.76.

As in the case of considering only Biology and Chemistry research, we fail to reject the null hypothesis as the observed significance of 0.973 for the Pearson Chi-

Square exceeds the desired  $\alpha$  level of 0.05. We conclude that students in the two courses are equally likely to enroll in upper division Natural Sciences research courses subsequent to their having successfully completed their General Chemistry laboratory.

### **Retention in Science and Engineering Majors**

A reasonable question is if the 1878 successful students over the study period remain in a science or engineering major. Defining science and engineering majors as before, the enrollment on the twelfth class day, by college, of the students who successfully completed either the experimental or control course in Spring 1999 is outlined in Table 62.

Table 62: Enrollment by College, Spring 1999

	<b>Control</b>	<b>Experimental</b>	<b>Total</b>
<b>Architecture</b>	0	0	0
<b>Business</b>	8	2	10
<b>Communication</b>	3	0	3
<b>Education</b>	5	2	7
<b>Engineering</b>	60	15	75
<b>Fine Arts</b>	2	0	2
<b>Liberal Arts</b>	50	22	72
<b>Natural Sciences</b>	220	103	323
<b>Nursing</b>	4	0	4
<b>Pharmacy</b>	0	0	0
<b>Social Work</b>	0	0	0
<b>Total</b>	352	144	496

Similarly, for Fall 1999, Table 63 outlines the enrollment by school for the control and experimental courses.

Table 63: Enrollment by College, Fall 1999

	<b>Control</b>	<b>Experimental</b>	<b>Total</b>
<b>Architecture</b>	0	0	0
<b>Business</b>	5	2	7
<b>Communication</b>	2	0	2
<b>Education</b>	3	2	5
<b>Engineering</b>	17	12	29
<b>Fine Arts</b>	1	1	2
<b>Liberal Arts</b>	27	22	49
<b>Natural Sciences</b>	149	89	238
<b>Nursing</b>	1	2	3
<b>Pharmacy</b>	0	0	0
<b>Social Work</b>	0	0	0
<b>Total</b>	205	130	335

The data for Spring 2000 also includes that of the groups with the common TA, although these data are analyzed later. Table 64 reveals the enrollment data for Spring 2000.

Table 64: Enrollment by College, Spring 2000

	<b>Control</b>		<b>Experimental</b>		<b>Total</b>
	<b>Without Common TA</b>	<b>With Common TA</b>	<b>Without Common TA</b>	<b>With Common TA</b>	
<b>Architecture</b>	0	0	0	0	0
<b>Business</b>	9	0	3	1	13
<b>Communication</b>	1	0	1	0	2
<b>Education</b>	3	0	1	1	5
<b>Engineering</b>	50	1	14	3	68
<b>Fine Arts</b>	1	0	2	0	3
<b>Liberal Arts</b>	30	2	13	3	48
<b>Natural Sciences</b>	287	16	99	12	414
<b>Nursing</b>	6	0	0	0	6
<b>Pharmacy</b>	0	0	0	0	0
<b>Social Work</b>	0	1	0	0	1
<b>Total</b>	387	20	133	20	560

Spring 2001 has three student groups, only two of which are of interest for the study at hand. These data are presented in Table 65.

Table 65: Spring 2001 Enrollment by College

	<b>Control</b>	<b>Experimental</b>	<b>PENS</b>	<b>Total</b>
<b>Architecture</b>	1	0	0	1
<b>Business</b>	13	2	0	15
<b>Communication</b>	2	2	0	4
<b>Education</b>	10	0	0	10
<b>Engineering</b>	57	5	0	62
<b>Fine Arts</b>	3	1	1	5
<b>Liberal Arts</b>	37	9	0	46
<b>Natural Sciences</b>	280	102	37	419
<b>Nursing</b>	2	0	0	2
<b>Pharmacy</b>	0	1	0	1
<b>Social Work</b>	0	0	0	0
<b>Total</b>	405	122	38	565

The data for the four semesters under study are summed and presented in Table

66.

Table 66: Enrollment by College for Control versus Experimental

	<b>Control</b>	<b>Experimental</b>	<b>Total</b>
<b>Architecture</b>	1	0	1
<b>Business</b>	35	9	44
<b>Communication</b>	8	3	11
<b>Education</b>	21	5	26
<b>Engineering</b>	184	46	230
<b>Fine Arts</b>	7	4	11
<b>Liberal Arts</b>	144	66	210
<b>Natural Sciences</b>	936	393	1329
<b>Nursing</b>	13	2	15
<b>Pharmacy</b>	0	1	1
<b>Social Work</b>	0	0	0
<b>Total</b>	1349	529	1878

As Table 66 shows, 1329 (70.8%) of the 1878 successful students in the experimental and control courses were in the College of Natural Sciences at the beginning of their laboratory experience. An additional 230 (12.2%) were in the College of Engineering. As in the analysis of Fall 1998, students are perceived as having been retained if they remain in degree programs in Natural Sciences, Engineering, or Pharmacy. Table 67 shows the number of students in the control group who began as Natural Science majors and who were retained as Natural Science, Engineering, or Pharmacy majors.

Table 67: Natural Sciences Retention in the Control Group

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Spring 1999</b>	220	149	8	16	173	78.6%
<b>Fall 1999</b>	149	118	1	4	123	82.6%
<b>Spring 2000</b>	287	221	5	10	236	82.2%
<b>Spring 2001</b>	280	218	4	15	237	84.6%
<b>Sum</b>	936	706	18	45	769	82.2%

Likewise, Table 68 shows retention data for Engineering majors in the control group.

Table 68: Engineering Retention in the Control Group

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Spring 1999</b>	60	10	39	1	50	83.3%
<b>Fall 1999</b>	17	5	10	0	15	88.2%
<b>Spring 2000</b>	50	10	31	0	41	82.0%
<b>Spring 2001</b>	57	4	49	0	53	93.0%
<b>Sum</b>	184	29	129	1	159	86.4%

In sum, 82.9% of successful students are retained as Science and Engineering majors within the control group, as shown in Table 69.

Table 69: Total Natural Sciences and Engineering Retention for the Control Group

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Science</b>	936	706	18	45	769	82.2%
<b>Engineering</b>	184	29	129	1	159	86.4%
<b>Total</b>	1120	735	147	46	928	82.9%

Turning our attention to the experimental group, Table 70 shows the number of students who began as Natural Science majors and who were retained as Natural Science, Engineering, or Pharmacy majors.

Table 70: Natural Sciences Retention in the Experimental Group

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Spring 1999</b>	103	74	3	3	80	77.7%
<b>Fall 1999</b>	89	57	0	5	62	69.7%
<b>Spring 2000</b>	99	65	0	11	76	76.8%
<b>Spring 2001</b>	102	80	1	6	87	85.3%
<b>Sum</b>	393	276	4	25	305	77.6%

Retention data for Engineering majors in the experimental group is presented in Table 71.

Table 71: Engineering Retention in the Experimental Group

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Spring 1999</b>	15	1	11	1	13	86.7%
<b>Fall 1999</b>	12	2	10	0	12	100%
<b>Spring 2000</b>	14	2	9	0	11	78.6%
<b>Spring 2001</b>	5	1	4	0	5	100%
<b>Sum</b>	46	6	34	1	41	89.1%

In sum, 78.8% of successful students are retained as Science and Engineering majors within the experimental group, as shown in Table 72.

Table 72: Total Natural Sciences and Engineering Retention for the Experimental Group

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Science</b>	393	276	4	25	305	77.6%
<b>Engineering</b>	46	6	34	1	41	89.1%
<b>Total</b>	439	282	38	26	346	78.8%

A  $\chi^2$  analysis is then performed to determine if students in one group are more likely to be retained as Science or Engineering majors. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the retention rate as Science, Engineering, and Pharmacy majors for students in the experimental course as compared to the retention rate of the students in the control course. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which

is that there is a difference in the retention rates between the students in the two courses. A summary of the retention data is found in Table 73.

Table 73: Summary of Retention Data for Control versus Experimental

Course * Retention Crosstabulation				
Count		Retention		Total
		Not Retained	Retained	
Course	Control	192	928	1120
	Experimental	93	346	439
Total		285	1274	1559

The  $\chi^2$  analysis on the retention data is shown in Table 74.

Table 74:  $\chi^2$  analysis on Retention Data for Control versus Experimental

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	3.449 <sup>b</sup>	1	.063	.069	.038
Continuity Correction <sup>a</sup>	3.183	1	.074		
Likelihood Ratio	3.371	1	.066		
Fisher's Exact Test					
Linear-by-Linear Association	3.446	1	.063		
N of Valid Cases	1559				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 80.25.

Based on the observed significance of 0.063 for the Pearson Chi-Square, we fail to reject the null hypothesis and conclude that students in the control and experimental

groups are equally likely to be retained as Natural Sciences, Engineering, or Pharmacy majors.

## EVALUATION OF THE EFFECT OF THE TEACHING ASSISTANT

In Spring 2000, by chance, one section of the control laboratory course and one section of the experimental laboratory course had the same teaching assistant in charge of the laboratory. Although the numbers of students in each section was small (20 in each case), the circumstance provides us with an opportunity to evaluate what impact the teaching assistant had on the control and experimental courses.

### Survey Data

The same survey as was given all of the other students in the experimental course was given to the students in these two sections. 30 surveys were returned in total, 18 from the control group and 12 from the experimental group. Although the number of surveys returned is not large, a summary of the responses from the experimental and control groups for the common questions is presented in Table 75. The full set of survey responses appears in Appendix H.

Table 75: Survey Data for Control versus Experimental

New #	Statement	Control	Experimental
<i>IMPACT ON LEARNING</i>			
10	Activities: Lab Lecture	3.111 $\pm$ 1.278	2.917 $\pm$ 1.165
11	Activities: Wet Lab	2.778 $\pm$ 1.215	4.333 $\pm$ 0.492
12	Activities: Exams	2.500 $\pm$ 1.366	3.333 $\pm$ 0.492
13	Activities: Quizzes	2.667 $\pm$ 1.237	3.083 $\pm$ 0.900
14	Activities: Homework/Exercises	2.222 $\pm$ 1.114	2.500 $\pm$ 0.905

New #	Statement	Control	Experimental
<i>INTEREST IN..</i>			
34	Studying Chemistry in General	3.000 $\pm$ 1.283	3.167 $\pm$ 1.030
35	Taking More Chemistry	2.667 $\pm$ 1.188	3.083 $\pm$ 1.165
36	Pursuing a Chemistry-Related Major	2.278 $\pm$ 0.826	2.833 $\pm$ 1.267
37	Pursuing a Science-Related Field	3.944 $\pm$ 1.305	4.500 $\pm$ 0.522
38	Working with Others to Learn Science	3.833 $\pm$ 1.200	4.250 $\pm$ 0.754
39	Chemistry in Industry	2.444 $\pm$ 1.097	1.917 $\pm$ 0.900
40	Chemistry in Medicine	3.611 $\pm$ 1.290	4.250 $\pm$ 0.754
41	Chemistry in the Environment	2.833 $\pm$ 1.043	2.500 $\pm$ 1.000
42	Science in General	3.778 $\pm$ 1.166	4.167 $\pm$ 0.937
<i>IMPRESSIONS OF LECTURE</i>			
43	I enjoyed the formal laboratory (1 hour) lectures.	2.706 $\pm$ 0.985	2.500 $\pm$ 1.087
44	The organization of the lectures was important for my learning.	3.294 $\pm$ 1.312	3.417 $\pm$ 0.996
45	The applications of chemistry discussed in this course made certain concepts easier to understand.	2.706 $\pm$ 1.359	3.833 $\pm$ 0.937
46	The applications of chemistry discussed in this course made learning chemistry interesting.	2.529 $\pm$ 1.419	3.750 $\pm$ 0.754
<i>IMPRESSIONS OF LABS</i>			
47	I enjoyed the labs.	2.118 $\pm$ 1.219	4.000 $\pm$ 0.632
48	I understood the chemistry behind the labs before I did them.	2.235 $\pm$ 1.091	2.909 $\pm$ 1.044
49	Eventually I understood the chemistry behind the labs.	2.882 $\pm$ 1.409	4.273 $\pm$ 0.647

Table 75 continues on the next page

Table 75, continued

New #	Statement	Control	Experimental
50	The labs helped me understand important concepts in this course.	2.353 $\pm$ 1.320	4.182 $\pm$ 0.603
51	Enough time was allowed for labs.	3.235 $\pm$ 1.348	4.091 $\pm$ 1.044
<i>GENERAL QUESTION</i>			
52	Would you recommend this course to a friend?	1.667 $\pm$ 1.291	3.900 $\pm$ 0.876

As was the case with the larger group of students, a MANOVA (Multiple Analysis of Variance) is utilized to analyze the survey results. Applying the Bonferroni correction, the desired  $\alpha$  level of 0.05 is adjusted to  $0.05/43 = 0.00116$ . First, however, an overall MANOVA is performed to determine if students in the two groups responded differently to the survey, as shown in Table 76.

Table 76: Overall MANOVA for Sections with the Common TA, Spring 2000

Multivariate Tests <sup>b</sup>						
Effect		Value	F	Hypothesis df	Error df	Sig.
Intercept	Pillai's Trace	1.000	3071.027 <sup>a</sup>	25.000	1.000	.014
	Wilks' Lambda	.000	3071.027 <sup>a</sup>	25.000	1.000	.014
	Hotelling's Trace	76775.679	3071.027 <sup>a</sup>	25.000	1.000	.014
	Roy's Largest Root	76775.679	3071.027 <sup>a</sup>	25.000	1.000	.014
Q1	Pillai's Trace	1.000	1213.621 <sup>a</sup>	25.000	1.000	.023
	Wilks' Lambda	.000	1213.621 <sup>a</sup>	25.000	1.000	.023
	Hotelling's Trace	30340.521	1213.621 <sup>a</sup>	25.000	1.000	.023
	Roy's Largest Root	30340.521	1213.621 <sup>a</sup>	25.000	1.000	.023

a. Exact statistic

b. Design: Intercept+Q1

As the observed significance of 0.023 is less than our desired  $\alpha$  level of 0.05, the null hypothesis that there is no difference between the student groups is rejected in favor of the alternative hypothesis, which is that the students in the two laboratory groups

responded differently to the survey. With this result in hand, analysis of individual items on the survey is appropriate. Of the 30 surveys that were received, only 15 in the control group and 12 in the experimental group had all items marked. Uncompleted surveys were not considered in the analysis. An item-by-item analysis follows in Table 77.

Table 77: MANOVA Survey Results for Sections with the Common TA, Spring 2000

In only 3 of the questions is a difference between the control and experimental group found. The control group responded more positively to q39, “Interest in Chemistry in Industry”, and the experimental group responded more positively to q33, “Confidence in Ability to Succeed in a Chemistry-Related Discipline” and q45, “the Applications of chemistry discussed in this course made certain concepts easier to understand”.

### **Drop and Withdraw Data**

No student in the control or experimental course dropped or withdrew from their laboratory course. As a result, no evaluation of the impact of the teaching assistant on the drop and withdraw rate can be determined.

### **Longitudinal Studies**

Focusing solely on students who were in sections with the common TA, all 40 students were successful in Spring 2000, as shown in Table 78.

Table 78: Final Course Grades for Sections with the Common TA, Spring 2000

	<b>A</b>	<b>B</b>	<b>C</b>	<b>CR</b>	<b>D</b>	<b>F</b>	<b>Q</b>	<b>W</b>	<b>Students</b>	<b>% Success</b>
<b>Control</b>	5	10	5	0	0	0	0	0	20	100%
<b>Experimental</b>	9	7	4	0	0	0	0	0	20	100%

As a result, we are able to perform the same analyses as was done for the standard control versus experimental groups.

### **Enrollment in Research Courses**

A small number of students from these sections went on to take upper division research courses in Biology or Chemistry as well as other areas within the College of Natural Sciences. As was done for all other control and experimental groups, data were obtained from the registrar and are analyzed here. Focusing first only on Biology and Chemistry, a summary of the enrollment data is presented in Table 79.

Table 79: Biology and Chemistry Research Enrollment in Sections with the Common TA

	<b>Took Biology or Chemistry Research</b>	<b>Did Not Take Biology or Chemistry Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	2	18	20	10.0%
<b>Experimental</b>	4	16	20	20.0%
<b>Total</b>	6	34	40	15.0%

A  $\chi^2$  analysis is then performed to determine if one group of students is more likely to participate in an upper division Natural Sciences research course. An  $\alpha$  level of

0.05 is selected. The null hypothesis is that there is no difference in the number of students who subsequently enroll in upper division Natural Sciences research courses in the experimental course as compared to students in the control course. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that students in one course enroll more frequently in subsequent upper division Natural Sciences research courses than students in the other course. A summary of the enrollment information is found in Table 80.

Table 80: Biology and Chemistry Research Course Enrollment in Sections with the Common TA

Course * ChemBio Crosstabulation				
Count		ChemBio		Total
		Did Not Take Chem or Bio Upper Div Research	Took Chem or Bio Upper Div Research	
Course	Control	18	2	20
	Experimental	16	4	20
Total		34	6	40

To determine statistical significance, a  $\chi^2$  analysis is performed and shown in Table 81.

Table 81:  $\chi^2$  analysis on Biology and Chemistry Research Course Enrollment in Sections with the Common TA, Spring 2000

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	.784 <sup>b</sup>	1	.376		
Continuity Correction <sup>a</sup>	.196	1	.658		
Likelihood Ratio	.797	1	.372		
Fisher's Exact Test				.661	.331
Linear-by-Linear Association	.765	1	.382		
N of Valid Cases	40				

a. Computed only for a 2x2 table

b. 2 cells (50.0%) have expected count less than 5. The minimum expected count is 3.00.

Based on the observed significance, we fail to reject the null hypothesis and conclude that students in the two courses are equally likely to enroll in Biology or Chemistry research courses subsequent to their having successfully completed their General Chemistry laboratory.

Broadening the research course selection to any upper division research course within the realm of the College of Natural Sciences, Table 82 focuses on those students in sections with the common TA in Spring 2000.

Table 82: Natural Sciences Research Enrollment in Sections without the Common TA, Spring 2000

	<b>Took Upper Division Research</b>	<b>Did Not Take Upper Division Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	2	18	20	10.0%
<b>Experimental</b>	5	15	20	25.0%
<b>Total</b>	7	33	40	17.5%

A  $\chi^2$  analysis is then performed to determine if one group of students is more likely to participate in an upper division Natural Sciences research course. The same  $\alpha$  level and null hypothesis apply here as in the case of only Biology and Chemistry research courses. A summary of the enrollment information is found in Table 83.

Table 83: Upper Division Natural Sciences Research Course Enrollment in Sections with the Common TA

**Course \* AllUpperDiv Crosstabulation**

Count		AllUpperDiv		Total
		Did Not Take an Upper Div Research Course	Took an Upper Div Research Course	
Course	Control	18	2	20
	Experimental	15	5	20
Total		33	7	40

The  $\chi^2$  analysis is shown in Table 84.

Table 84:  $\chi^2$  analysis on Upper Division Natural Sciences Research Course Enrollment in Sections with the Common TA, Spring 2000

**Chi-Square Tests**

	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	1.558 <sup>b</sup>	1	.212		
Continuity Correction <sup>a</sup>	.693	1	.405		
Likelihood Ratio	1.601	1	.206		
Fisher's Exact Test				.407	.204
Linear-by-Linear Association	1.519	1	.218		
N of Valid Cases	40				

a. Computed only for a 2x2 table

b. 2 cells (50.0%) have expected count less than 5. The minimum expected count is 3.50.

As in the case of considering only Biology and Chemistry research, we fail to reject the null hypothesis as the observed significance of 0.212 for the Pearson Chi-Square exceeds the desired  $\alpha$  level of 0.05. We conclude that students in the control and experimental groups are equally likely to enroll in upper division Natural Sciences research courses subsequent to their having successfully completed their General Chemistry laboratory.

### **Retention in Science and Engineering Majors**

Defining science and engineering majors as before, the enrollment on the twelfth class day, by college, of the students who successfully completed either the experimental or control course in Spring 2000 is outlined in Table 85.

Table 85: Enrollment by College, Spring 2000

	<b>Control</b>		<b>Experimental</b>		<b>Total</b>
	<b>Without Common TA</b>	<b>With Common TA</b>	<b>Without Common TA</b>	<b>With Common TA</b>	
<b>Architecture</b>	0	0	0	0	0
<b>Business</b>	9	0	3	1	13
<b>Communication</b>	1	0	1	0	2
<b>Education</b>	3	0	1	1	5
<b>Engineering</b>	50	1	14	3	68
<b>Fine Arts</b>	1	0	2	0	3
<b>Liberal Arts</b>	30	2	13	3	48
<b>Natural Sciences</b>	287	16	99	12	414
<b>Nursing</b>	6	0	0	0	6
<b>Pharmacy</b>	0	0	0	0	0
<b>Social Work</b>	0	1	0	0	1
<b>Total</b>	387	20	133	20	560

Comparing only those sections which had the common TA, Table 86 shows the number of students who began as Natural Science majors and who were retained as Natural Science, Engineering, or Pharmacy majors in Spring 2000 for both the experimental and control courses.

Table 86: Natural Sciences Retention in Sections with the Common TA

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Control</b>	16	13	0	1	14	87.5%
<b>Experimental</b>	12	10	0	1	11	91.7%

Likewise, Table 87 shows retention data for Engineering majors in those sections.

Table 87: Engineering Retention in Sections with the Common TA

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Control</b>	1	0	0	1	1	100.0
<b>Experimental</b>	3	1	2	0	3	100.0

In sum, 90.6% of successful students are retained as Science and Engineering majors between the two sections, as shown in Table 88.

Table 88: Total Natural Sciences and Engineering Retention in Sections with the Common TA, Spring 2000

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Control</b>	17	13	0	2	15	88.2
<b>Experimental</b>	15	11	2	1	14	93.3
<b>Total</b>	32	24	2	3	29	90.6%

A  $\chi^2$  analysis is then performed to determine if students in one group are more likely to be retained as Science or Engineering majors. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the retention rate as Science, Engineering, and Pharmacy majors for students in the experimental course as compared to the retention rate of the students in the control course. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which

is that there is a difference in the retention rates between the students in the two courses. A summary of the retention data is found in Table 89.

Table 89: Summary of Retention Data in Sections with the Common TA, Spring 2000

Course * Retention Crosstabulation				
Count		Retention		Total
		Not Retained	Retained	
Course	Control	2	15	17
	Experimental	1	14	15
Total		3	29	32

The  $\chi^2$  analysis on the retention data is shown in Table 39.

Table 90:  $\chi^2$  analysis on Retention Data in Sections with the Common TA

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	.244 <sup>b</sup>	1	.621	1.000	.548
Continuity Correction <sup>a</sup>	.000	1	1.000		
Likelihood Ratio	.249	1	.618		
Fisher's Exact Test					
Linear-by-Linear Association	.236	1	.627		
N of Valid Cases	32				

a. Computed only for a 2x2 table

b. 2 cells (50.0%) have expected count less than 5. The minimum expected count is 1.41.

Based on the observed significance of 0.621 for the Pearson Chi-Square, we fail to reject the null hypothesis and conclude that students in the control and experimental

groups are equally likely to be retained as Natural Sciences, Engineering, or Pharmacy majors.

## EFFECT OF A DIFFERENT INSTRUCTOR ON THE EXPERIMENTAL COURSE

In Fall 2000, the head teaching assistant assumed the role of the instructor for the experimental course. One section of the experimental course was also chosen by the College of Natural Sciences to service the PENS (Partnership for Excellence in the Natural Sciences) students. The analysis of the impact of the experimental course on these students follows this section.

### Survey Data

The same survey that was used in Spring 2000 was employed again for students in the experimental, control, and PENS groups. A total of 100 surveys were returned: 39 from the control group, 46 from the experimental group, and 15 from the PENS group. The surveys from the PENS group are excluded from this analysis. As before, only the common survey responses are included in Table 91, but the full set of survey responses appears for the control and experimental groups in Appendix I.

51	Enough time was allowed for labs.	3.351 $\pm$ 1.184	3.935 $\pm$ 1.181
<i>GENERAL QUESTION</i>			
52	Would you recommend this course to a friend?	2.216 $\pm$ 1.134	4.087 $\pm$ 1.092

As with the other survey data, a MANOVA (Multiple Analysis of Variance) is utilized to assess differences in student reaction to the two courses. An overall MANOVA is performed first in order to determine if students in the two groups respond differently to the survey. As has been the case in the analysis of previous surveys, the null hypothesis is that there is no difference in how students in the two groups respond to the survey. An  $\alpha$  level of 0.05 is selected, and should the observed significance be less than this value, the null hypothesis is rejected in favor of the alternative hypothesis, that there is a difference in how students in the two groups respond to the survey. The analysis is shown in Table 92.

Table 92: Overall MANOVA on Survey Data for Sections with the Different Instructor

Multivariate Tests <sup>b</sup>						
Effect		Value	F	Hypothesis df	Error df	Sig.

a. Exact statistic

b. Design: Intercept+Q1

The observed significance is indeed less than 0.05, implying that there are survey items on which students in the two groups responded differently. A question by question analysis follows. Using the Bonferroni correction, as previously described, implies that a calculated significance of less than 0.00116 represents a difference between the two student groups. Of the 85 surveys submitted by the control and experimental groups, only 34 from the control group and 40 from the experimental group were fully completed. Uncompleted surveys were not analyzed. The item-by-item analysis follows in Table 93.

 t R Squared = .027 (Adjusted R Squared = .013)  
 u R Squared = .025 (Adjusted R Squared = .012)  
 v R Squared = .023 (Adjusted R Squared = .009)  
 w R Squared = .011 (Adjusted R Squared = -.003)

Table 93 continues on the next page

Table 93, continued

x R Squared = .015 (Adjusted R Squared = .002)  
y R Squared = .035 (Adjusted R Squared = .022)  
z R Squared = .001 (Adjusted R Squared = -.012)  
aa R Squared = .014 (Adjusted R Squared = .001)  
bb R Squared = .017 (Adjusted R Squared = .003)  
cc R Squared = .024 (Adjusted R Squared = .010)  
dd R Squared = .033 (Adjusted R Squared = .019)  
ee R Squared = .393 (Adjusted R Squared = .384)

The analysis shows a difference in only one question, q52, “Would you recommend this course to a friend?” A histogram depicting the difference in response between the two groups is shown in Figure 4.

Figure 4: Histogram of “Would You Recommend This Course to a Friend?”, Different Instructor

## Drop and Withdraw Data

The number of students who either dropped or withdrew from the control and experimental groups, excluding the PENS students, is shown in Table 94.

Table 94: Drops and Withdraws, Different Instructor

	Q	W	Total Dropped	Students	% Dropped
<b>Control</b>	36	11	47	322	14.6%
<b>Experimental</b>	2	0	2	123	1.6%

Consistent with the pattern of previous semesters, the number of students who dropped the course with either a “Q” or “W” is higher in the control group than it is in the experimental group. For Fall 2000, as shown in Table 95, a total of 455 students were enrolled in the experimental and control courses at the twelfth class day.

Table 95: Drop-Withdraw Cases for the Control and Experimental Groups, Fall 2000

<b>Case Processing Summary</b>						
	Cases					
	Valid		Missing		Total	
	N	Percent	N	Percent	N	Percent
Course * Total	445	100.0%	0	.0%	445	100.0%

Of these 445 students, 123 were enrolled in the experimental course and 322 were enrolled in the control course, as shown in Table 96.

Table 96: Drop – Withdraw Count for the Control and Experimental Groups, Different Instructor

Course * Total Crosstabulation				
Count		Total		Total
		Finished Course	Dropped or Withdrawn	
Course	Control	275	47	322
	Experimental	121	2	123
Total		396	49	445

A  $\chi^2$  analysis is then performed to determine statistical significance. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the drop and withdraw rate of the students in the experimental course as compared to that of students in the control course. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that the drop and withdraw rates between the two courses are different. The  $\chi^2$  analysis is shown in Table 97.

Table 97:  $\chi^2$  analysis on Drop – Withdraw Data for the Control and Experimental Groups, Different Instructor

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	15.280 <sup>b</sup>	1	.000		
Continuity Correction <sup>a</sup>	13.985	1	.000		
Likelihood Ratio	20.491	1	.000		
Fisher's Exact Test				.000	.000
Linear-by-Linear Association	15.246	1	.000		
N of Valid Cases	445				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 13.54.

According to the analysis, we reject the null hypothesis as the observed significance (0.000 for the Pearson Chi-Square) is smaller than the desired  $\alpha$  level of 0.05 in favor of the alternative hypothesis, which is that there is a difference in the drop rate between the two courses. Thus, students in the control section in Fall 2000 are more likely to drop or withdraw than students in the experimental course.

### Longitudinal Studies

As with drop and withdraw data, we compare the control and experimental groups. A breakdown of the grade distribution in Fall 2000 appears in Table 98.

Table 98: Final Course Grades, Different Instructor

	A	B	C	CR	D	F	Q	W	Students	% Success
<b>Control</b>	52	97	62	1	40	23	36	11	322	65.8%
<b>Experimental</b>	43	57	19	0	2	0	2	0	123	96.8%

Only students who were successful in completing their laboratory course are considered for the longitudinal studies.

### **Enrollment in Research Courses**

Data from the registrar provides us with insight on which students took subsequent upper division research courses in Chemistry or Biology. Table 99 summarizes the number of successful students who took research courses in Chemistry or Biology after having been enrolled in either the control or experimental course in Fall 2000.

Table 99: Biology and Chemistry Research Enrollment for the Control and Experimental Groups, Different Instructor

	<b>Took Biology or Chemistry Research</b>	<b>Did Not Take Biology or Chemistry Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	24	188	212	11.3%
<b>Experimental</b>	20	99	119	16.8%
<b>Total</b>	44	287	331	13.3%

A  $\chi^2$  analysis is then performed to determine if students from one of the two laboratory courses is more likely to enroll in Biology or Chemistry research courses. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the number of students who subsequently enroll in Biology or Chemistry research courses in the experimental course as compared to students in the control course. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that students in one course enroll more frequently in subsequent

Biology or Chemistry research courses than students in the other course. A summary of the enrollment information is found in Table 100.

Table 100: Biology and Chemistry Research Course Enrollment in the Control and Experimental Groups, Different Instructor

Course * ChemBio Crosstabulation				
Count		ChemBio		Total
		Did Not Take Chem or Bio Upper Div Research	Took Chem or Bio Upper Div Research	
Course	Control	188	24	212
	Experimental	99	20	119
Total		287	44	331

To determine statistical significance, a  $\chi^2$  analysis is performed and shown in Table 101.

Table 101:  $\chi^2$  analysis on Biology and Chemistry Research Course Enrollment in the Control and Experimental Groups, Different Instructor

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	1.990 <sup>b</sup>	1	.158	.178	.108
Continuity Correction <sup>a</sup>	1.543	1	.214		
Likelihood Ratio	1.939	1	.164		
Fisher's Exact Test					
Linear-by-Linear Association	1.984	1	.159		
N of Valid Cases	331				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 15.82.

Based on the observed significance, we fail to reject the null hypothesis and conclude that students in the control and experimental groups are equally likely to enroll in Biology or Chemistry research courses subsequent to their having successfully completed their General Chemistry laboratory.

Considering any upper division research course within the realm of the College of Natural Sciences, Table 102 summarizes the enrollment data for the control and experimental groups in Fall 2000.

Table 102: Natural Sciences Research Enrollment, Different Instructor

	<b>Took Upper Division Research</b>	<b>Did Not Take Upper Division Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Control</b>	31	181	212	14.6%
<b>Experimental</b>	25	94	119	21.0%
<b>Total</b>	56	275	331	16.9%

A  $\chi^2$  analysis is then performed to determine if one group of students is more likely to participate in an upper division Natural Sciences research course. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the number of students who subsequently enroll in upper division Natural Sciences research courses in the experimental course as compared to students in the control course. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that students in one course enroll more frequently in subsequent upper division Natural Sciences research courses than students in the other course. A comparison of the control and experimental groups is found in Table 103.

Table 103: Upper Division Natural Sciences Research Course Enrollment in the Control and Experimental Groups, Different Instructor

Course * AllUpperDiv Crosstabulation				
Count		AllUpperDiv		Total
		Did Not Take an Upper Div Research Course	Took an Upper Div Research Course	
Course	Control	181	31	212
	Experimental	94	25	119
Total		275	56	331

The  $\chi^2$  analysis is shown in Table 104.

Table 104:  $\chi^2$  analysis on Upper Division Natural Sciences Research Course Enrollment in the Control and Experimental Groups, Different Instructor

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	2.211 <sup>b</sup>	1	.137		
Continuity Correction <sup>a</sup>	1.780	1	.182		
Likelihood Ratio	2.161	1	.142		
Fisher's Exact Test				.169	.092
Linear-by-Linear Association	2.204	1	.138		
N of Valid Cases	331				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 20.13.

As in the case of considering only Biology and Chemistry research, we fail to reject the null hypothesis as the observed significance of 0.137 for the Pearson Chi-

Square exceeds the desired  $\alpha$  level of 0.05. We conclude that students in the control and experimental groups are equally likely to enroll in upper division Natural Sciences research courses subsequent to their having successfully completed their General Chemistry laboratory.

### **Retention in Science and Engineering Majors**

Defining science and engineering majors as before, the enrollment on the twelfth class day, by college, of successful students in the control and experimental groups in Fall 2000 is outlined in Table 105.

Table 105: Enrollment by College, Different Instructor

	<b>Control</b>	<b>Experimental</b>	<b>Total</b>
<b>Architecture</b>	0	0	0
<b>Business</b>	2	7	9
<b>Communication</b>	3	2	5
<b>Education</b>	1	2	3
<b>Engineering</b>	27	3	30
<b>Fine Arts</b>	2	1	3
<b>Liberal Arts</b>	17	10	27
<b>Natural Sciences</b>	156	90	246
<b>Nursing</b>	4	4	8
<b>Pharmacy</b>	0	0	0
<b>Social Work</b>	0	0	0
<b>Total</b>	212	119	331

As Table 105 shows, 246 (74.3%) of the 331 successful students were in the College of Natural Sciences at the beginning of their laboratory experience. An additional 30 (9.1%) of the successful students were in the College of Engineering. Turning our attention to these 276 students, Table 106 shows the number of students who began as Natural Science majors and who were retained as Natural Science, Engineering, or Pharmacy majors in Fall 2000 for the two student groups.

Table 106: Natural Sciences Retention, Fall 2000

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Control</b>	156	118	4	3	125	80.1%
<b>Experimental</b>	90	70	0	2	72	80.0%

Likewise, Table 107 shows retention data for Engineering majors in Fall 2000.

Table 107: Engineering Retention, Different Instructor

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Control</b>	27	8	16	0	24	88.9%
<b>Experimental</b>	3	2	0	0	2	66.7%

In sum, 80.8% of successful students are retained as Science and Engineering majors, as shown in Table 108.

Table 108: Total Natural Sciences and Engineering Retention, Different Instructor

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Control</b>	183	126	20	3	149	81.4%
<b>Experimental</b>	93	72	0	2	74	79.6%
<b>Total</b>	276	198	20	5	223	80.8%

A  $\chi^2$  analysis is then performed to compare the control and experimental groups to evaluate any differences between these groups with respect to retention as Science or Engineering majors. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the retention rate as Science, Engineering, and Pharmacy majors for students between the groups being compared. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that there is a difference in the retention rates between the students in the two courses. A summary of the retention data is found in Table 109.

Table 109: Summary of Retention Data in the Control and Experimental Groups, Different Instructor

<b>Course * Retention Crosstabulation</b>				
Count		Retention		Total
		Not Retained	Retained	
Course	Control	34	149	183
	Experimental	19	74	93
Total		53	223	276

The  $\chi^2$  analysis on the retention data is shown in Table 110.

Table 110:  $\chi^2$  analysis on Retention Data in the Control and Experimental Groups,  
Different Instructor

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	.136 <sup>b</sup>	1	.712		
Continuity Correction <sup>a</sup>	.043	1	.836		
Likelihood Ratio	.135	1	.713		
Fisher's Exact Test				.748	.414
Linear-by-Linear Association	.136	1	.713		
N of Valid Cases	276				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 17.86.

Based on the observed significance for the Pearson Chi-Square, we fail to reject the null hypothesis and conclude that students in the control and experimental groups are equally likely to be retained as Natural Sciences, Engineering, or Pharmacy majors.

### EFFECT OF THE EXPERIMENTAL COURSE ON AN AT-RISK STUDENT GROUP

Students in the Partnership for Excellence in the Natural Sciences (PENS) appeared in the experimental course twice over the study period. One section of PENS students, comprising 17 individuals, appeared in Fall 2000, while in Spring 2001, two sections with a total of 41 students took part in the experimental course. This group of students was perceived by the University to be at risk for not being able to graduate with major in the Natural Sciences. Unlike other students who selected their laboratory course on their own and, in principle, could select either the control or experimental course at any time it was offered, PENS students were assigned specific sections unique to them. Hence, this group of students is different than other students in the experimental course.

As these students only appeared in the experimental course, their fates are compared to other students in the experimental course during the Fall 2000-Spring 2001 timeframe.

### Survey Data

PENS students received the same survey as other students in both the experimental and control courses. In an effort to maximize the number of surveys analyzed, data from Fall 2000 and Spring 2001 are combined for analysis, although the full set of survey data appears in Appendices J (for Fall 2000) and K (for Spring 2001). Combining these two semesters, a summary of the survey responses appears in Table 111, below.

Table 111: Survey Data for Experimental versus PENS

New #	Statement	Experimental	PENS
<i>IMPACT ON LEARNING</i>			
10	Activities: Lab Lecture	3.106 $\pm$ 1.114	2.769 $\pm$ 1.165

New #	Statement	Experimental	PENS
50	The labs helped me understand important concepts in this course.	3.656 $\pm$ 0.917	3.212 $\pm$ 1.242
51	Enough time was allowed for labs.	3.987 $\pm$ 1.162	2.942 $\pm$ 1.420
<i>GENERAL QUESTION</i>			
52	Would you recommend this course to a friend?	3.689 $\pm$ 1.292	2.500 $\pm$ 1.350

As with previous analyses, a MANOVA is analyzed to assess differences, if any, in student reaction. In this case, the student groups come from (possibly) different populations but are evaluating the same experience. First, an overall MANOVA is performed to confirm that there is a difference between the two student groups. An  $\alpha$  level of 0.05 is selected, and an observed significance less than this value indicates a difference in student opinion as measured by the survey. The result of this test is shown in Table 112.

Table 112: Overall MANOVA, Experimental versus PENS

Multivariate Tests <sup>b</sup>						
Effect		Value	F	Hypothesis df	Error df	Sig.
Intercept	Pillai's Trace	.980	168.814 <sup>a</sup>	43.000	146.000	.000
	Wilks' Lambda	.020	168.814 <sup>a</sup>	43.000	146.000	.000
	Hotelling's Trace	49.719	168.814 <sup>a</sup>	43.000	146.000	.000
	Roy's Largest Root	49.719	168.814 <sup>a</sup>	43.000	146.000	.000
Q1	Pillai's Trace	.387	2.141 <sup>a</sup>	43.000	146.000	.000
	Wilks' Lambda	.613	2.141 <sup>a</sup>	43.000	146.000	.000
	Hotelling's Trace	.631	2.141 <sup>a</sup>	43.000	146.000	.000
	Roy's Largest Root	.631	2.141 <sup>a</sup>	43.000	146.000	.000

a. Exact statistic

b. Design: Intercept+Q1

The result of this analysis suggests that there is a difference in how students in the two groups responded to the survey. With this difference confirmed, an item-by-item analysis is appropriate, and the results of this analysis are shown in Table 113. Of the 207 surveys collected, 140 in the Experimental group and 50 in the PENS group had all items marked and were evaluated. Uncompleted surveys were not analyzed. As before, a Bonferroni correction was applied to control the Type I error rate as 43 items on the survey were analyzed. The null hypothesis is that there is no difference in how students responded to each individual item on the survey. Should the observed significance be less than 0.00116, the null hypothesis is rejected in favor of the alternative hypothesis, which is that there is a difference in student opinion on that survey item.

Table 113: Survey Results, Experimental versus PENS

**Tests of Between-Subjects Effects**

y	R Squared = .139 (Adjusted R Squared = .134)

Only on 2 questions is a difference in student opinion found: q51, “enough time was allowed for labs” and q52, “Would you recommend this course to a friend?” In both cases, students in the experimental group responded to these questions in a more positive manner.

### **Drop and Withdraw Data**

As has been performed on the other comparisons in this dissertation, an analysis of student persistence in the experimental course CH 204AV is presented here. As PENS students appeared in the CH 204AV in two semesters, the data for each individual semester are displayed individually and then collectively for analysis. The drop and withdraw data for Fall 2000 for the Experimental and PENS students is shown in Table 114.

Table 114: Drops and Withdraws, Fall 2000

	<b>Q</b>	<b>W</b>	<b>Total Dropped</b>	<b>Students</b>	<b>% Dropped</b>
<b>Experimental</b>	2	0	2	123	1.6%
<b>PENS</b>	0	0	0	17	0%

Parallel data for Spring 2001 were obtained and are displayed in Table 115. Of the 8 sections of CH 204AV offered in Spring 2001, 2 were earmarked for PENS students.

Table 115: Drops and Withdraws, Spring 2001

	<b>Q</b>	<b>W</b>	<b>Total Dropped</b>	<b>Students</b>	<b>% Dropped</b>
<b>Experimental</b>	5	2	7	135	5.2%
<b>PENS</b>	0	1	1	41	2.4%

The combination of these two semesters is shown in Table 116.

Table 116: Drops and Withdraws, Experimental versus PENS

	<b>Q</b>	<b>W</b>	<b>Total Dropped</b>	<b>Students</b>	<b>% Dropped</b>
<b>Experimental</b>	7	2	9	258	3.5%
<b>PENS</b>	0	1	1	58	1.7%

To determine if students in the Experimental group are more likely to drop the CH 204AV course, a  $\chi^2$  analysis is performed. The  $\alpha$  level is again set to 0.05, and the null hypothesis is that there is no difference in the drop rate between the Experimental and

PENS students. An observed significance of less than 0.05 indicates that the alternative hypothesis must be true, that students in the Experimental group drop the course more frequently than PENS students. The result of the analysis is shown in Table 117.

Table 117:  $\chi^2$  analysis on Drop – Withdraw Data for the Control and Experimental Groups, Experimental versus PENS

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	.481 <sup>b</sup>	1	.488		
Continuity Correction <sup>a</sup>	.078	1	.781		
Likelihood Ratio	.554	1	.457		
Fisher's Exact Test				.696	.424
Linear-by-Linear Association	.479	1	.489		
N of Valid Cases	316				

a. Computed only for a 2x2 table

b. 1 cells (25.0%) have expected count less than 5. The minimum expected count is 1.84.

According to the analysis, we fail to reject the null hypothesis as the observed significance (0.488 for the Pearson Chi-Square) is larger than the desired  $\alpha$  level of 0.05. Thus, there is no difference in the drop rate between Experimental and PENS students in the experimental course CH 204AV.

## Longitudinal Studies

Data on the subsequent enrollment patterns of Experimental and PENS students were collected in Summer 2005, at which time virtually all of these students would have finished their undergraduate careers at The University of Texas at Austin. Of particular interest is retention in a Science or Engineering major, as defined before, and enrollment

in a research course. These analyses are properly done on students who completed CH 204AV successfully. Most students were successful in doing so, as Table 118 depicts for Fall 2000.

Table 118: Final Course Grades, Fall 2000

	<b>A</b>	<b>B</b>	<b>C</b>	<b>CR</b>	<b>D</b>	<b>F</b>	<b>Q</b>	<b>W</b>	<b>Students</b>	<b>% Success</b>
<b>Experimental</b>	43	57	19	0	2	0	2	0	123	96.7%
<b>PENS</b>	3	7	7	0	0	0	0	0	17	100%

Similarly, Table 119 shows this data for Spring 2001.

Table 119: Final Course Grades, Spring 2001

	<b>A</b>	<b>B</b>	<b>C</b>	<b>CR</b>	<b>D</b>	<b>F</b>	<b>Q</b>	<b>W</b>	<b>Students</b>	<b>% Success</b>
<b>Experimental</b>	56	50	16	0	4	2	5	2	135	90.4%
<b>PENS</b>	11	17	10	0	2	0	0	1	41	92.7%

Combining this information for both semesters shows us a composite of the success rates of PENS students versus Experimental students in the same time frame, displayed in Table 120.

Table 120: Final Course Grades, Experimental versus PENS

	<b>A</b>	<b>B</b>	<b>C</b>	<b>CR</b>	<b>D</b>	<b>F</b>	<b>Q</b>	<b>W</b>	<b>Students</b>	<b>% Success</b>
<b>Experimental</b>	99	107	35	0	6	2	7	2	258	93.4%
<b>PENS</b>	14	24	17	0	2	0	0	1	58	94.8%

It is upon these groups of successful students that our longitudinal studies are performed.

### **Enrollment in Research Courses**

Our first interest is determining if PENS students differ from the Experimental students in terms of enrolling in a subsequent research course in Chemistry or Biology, as defined before. This information is compiled for Fall 2000 in Table 121.

Table 121: Biology and Chemistry Research Enrollment for Experimental versus PENS, Fall 2000

	<b>Took Biology or Chemistry Research</b>	<b>Did Not Take Biology or Chemistry Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Experimental</b>	20	99	119	16.8%
<b>PENS</b>	0	17	17	0%
<b>Total</b>	20	116	136	14.7%

For Spring 2001, three PENS students pursued upper division research courses in Biology or Chemistry. Data are tabulated in Table 122.

Table 122: Biology and Chemistry Research Enrollment for Experimental versus PENS, Spring 2001

	<b>Took Biology or Chemistry Research</b>	<b>Did Not Take Biology or Chemistry Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Experimental</b>	16	106	122	13.1%
<b>PENS</b>	3	35	38	7.9%
<b>Total</b>	19	141	160	11.9%

Combining these two semesters in which PENS students were enrolled in CH 204AV for comparison with typical students taking the experimental course, Table 123 summarizes the result.

Table 123: Biology and Chemistry Research Enrollment, Experimental versus PENS

	<b>Took Biology or Chemistry Research</b>	<b>Did Not Take Biology or Chemistry Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Experimental</b>	36	205	241	14.9%
<b>PENS</b>	3	52	55	5.5%
<b>Total</b>	39	257	296	13.2%

A  $\chi^2$  analysis is then performed to determine if students from the experimental group is more likely to enroll in Biology or Chemistry research courses than students in the PENS group. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the number of students who subsequently enroll in Biology or Chemistry

research courses; however, if the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that students in the experimental group enroll more frequently in subsequent Biology or Chemistry research courses than PENS students. A summary of the enrollment information is found in Table 124.

Table 124: Biology and Chemistry Research Course Enrollment, Experimental versus PENS

Course * ChemBio Crosstabulation				
Count		ChemBio		Total
		Did Not Take Chem or Bio Upper Div Research	Took Chem or Bio Upper Div Research	
Course	Experimental	205	36	241
	PENS	52	3	55
Total		257	39	296

To determine statistical significance, a  $\chi^2$  analysis is performed and shown in Table 125.

Table 125:  $\chi^2$  analysis on Biology and Chemistry Research Course Enrollment, Experimental versus PENS

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	3.520 <sup>b</sup>	1	.061		
Continuity Correction <sup>a</sup>	2.740	1	.098		
Likelihood Ratio	4.200	1	.040		
Fisher's Exact Test				.076	.041
Linear-by-Linear Association	3.508	1	.061		
N of Valid Cases	296				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 7.25.

Based on the observed significance, we fail to reject the null hypothesis and conclude that PENS students are equally likely as typical students in the experimental course to enroll in Biology or Chemistry research courses subsequent to their having successfully completed their General Chemistry laboratory.

Broadening our consideration to any upper division research course in the Natural Sciences, we present data on subsequent research course enrollment in the Natural Science for students in the PENS group and typical experimental course students in Fall 2000 in Table 126.

Table 126: Upper Division Research Enrollment for Experimental versus PENS, Fall 2000

	<b>Took Upper Division Research</b>	<b>Did Not Take Upper Division Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Experimental</b>	25	94	119	21.0%
<b>PENS</b>	0	17	17	0%
<b>Total</b>	25	116	136	18.4%

Only three PENS students pursued upper division research courses in Spring 2001, and all three did so in Biology or Chemistry. Data for Spring 2001 is displayed in Table 127.

Table 127: Upper Division Research Enrollment for Experimental versus PENS, Spring 2001

	<b>Took Upper Division Research</b>	<b>Did Not Take Upper Division Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Experimental</b>	19	103	122	15.6%
<b>PENS</b>	3	35	38	7.9%
<b>Total</b>	22	138	160	13.8%

The merger of these two semesters is shown in Table 128.

Table 128: Natural Sciences Research Enrollment for Experimental versus PENS

	<b>Took Upper Division Research</b>	<b>Did Not Take Upper Division Research</b>	<b>Successful Students</b>	<b>% Taking Research</b>
<b>Experimental</b>	44	197	241	18.3%
<b>PENS</b>	3	52	55	5.5%
<b>Total</b>	47	249	296	15.9%

A  $\chi^2$  analysis is performed to determine if one group of students is more likely to participate in an upper division Natural Sciences research course. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the numbers of students who subsequently enroll in upper division Natural Sciences research course. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that typical students in the experimental course enroll more frequently in subsequent upper division Natural Sciences research courses than PENS students. A summary of the enrollment information is found in Table 129.

Table 129: Upper Division Natural Sciences Research Course Enrollment for Experimental versus PENS

Course * AllUpperDiv Crosstabulation				
Count		AllUpperDiv		Total
		Did Not Take an Upper Div Research Course	Took an Upper Div Research Course	
Course	Experimental	197	44	241
	PENS	52	3	55
Total		249	47	296

The  $\chi^2$  analysis is shown in Table 130.

Table 130:  $\chi^2$  analysis on Upper Division Natural Sciences Research Course Enrollment for Experimental versus PENS

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	5.495 <sup>b</sup>	1	.019		
Continuity Correction <sup>a</sup>	4.578	1	.032		
Likelihood Ratio	6.721	1	.010		
Fisher's Exact Test				.023	.011
Linear-by-Linear Association	5.477	1	.019		
N of Valid Cases	296				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 8.73.

Unlike the case of considering only Biology and Chemistry research, we reject the null hypothesis as the observed significance of 0.019 for the Pearson Chi-Square is less

than the desired  $\alpha$  level of 0.05. We conclude that typical students in the experimental course are more likely to enroll in upper division Natural Sciences research courses subsequent to their having successfully completed their General Chemistry laboratory than PENS students.

### **Retention in Science and Engineering Majors**

One of the chief aims of the PENS program was not only to have these at-risk students successfully finish an undergraduate degree, but to do so with a major in Natural Sciences. We now consider the role, if any, that the experimental course may have had in achieving that goal.

Defining science and engineering majors as before, the enrollment on the twelfth class day, by college, of successful students in the experimental and PENS groups in Fall 2000 is outlined in Table 131.

Table 131: Enrollment by College, Fall 2000

	<b>Experimental</b>	<b>PENS</b>	<b>Total</b>
<b>Architecture</b>	0	0	0
<b>Business</b>	7	0	7
<b>Communication</b>	2	0	2
<b>Education</b>	2	0	2
<b>Engineering</b>	3	1	4
<b>Fine Arts</b>	1	0	1
<b>Liberal Arts</b>	10	1	11
<b>Natural Sciences</b>	90	15	105
<b>Nursing</b>	4	0	4
<b>Pharmacy</b>	0	0	0
<b>Social Work</b>	0	0	0
<b>Total</b>	119	17	136

Similar data for Spring 2001 was obtained and is shown in Table 132.

Table 132: Spring 2001 Enrollment by College

	<b>Experimental</b>	<b>PENS</b>	<b>Total</b>
<b>Architecture</b>	0	0	0
<b>Business</b>	2	0	2
<b>Communication</b>	2	0	2
<b>Education</b>	0	0	0
<b>Engineering</b>	5	0	5
<b>Fine Arts</b>	1	1	2
<b>Liberal Arts</b>	9	0	9
<b>Natural Sciences</b>	102	37	139
<b>Nursing</b>	0	0	0
<b>Pharmacy</b>	1	0	1
<b>Social Work</b>	0	0	0
<b>Total</b>	122	38	160

Combining these two semesters, we derive Table 133, which shows the total enrollment, by college, of successful students in the time period in which PENS students took the experimental course.

Table 133: Enrollment by College, Experimental versus PENS

	<b>Experimental</b>	<b>PENS</b>	<b>Total</b>
<b>Architecture</b>	0	0	0
<b>Business</b>	9	0	9
<b>Communication</b>	4	0	4
<b>Education</b>	2	0	2
<b>Engineering</b>	8	1	9
<b>Fine Arts</b>	2	1	3
<b>Liberal Arts</b>	19	1	20
<b>Natural Sciences</b>	192	52	244
<b>Nursing</b>	4	0	4
<b>Pharmacy</b>	1	0	1
<b>Social Work</b>	0	0	0
<b>Total</b>	241	55	296

The large majority of students, 244 (82.4%) of the 296 successful students, were in the College of Natural Sciences at the beginning of their laboratory experience, as shown in Table 133. A much smaller number, 9 (3.0%) of the successful students, were in the College of Engineering. Considering these 253 students, Table 134 shows the number of students who began as Natural Science majors and who were retained as Natural Science, Engineering, or Pharmacy majors in Fall 2000 for typical experimental and PENS students.

Table 134: Natural Sciences Retention, Fall 2000

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Experimental</b>	90	70	0	2	72	80.0%
<b>PENS</b>	15	8	0	1	9	60.0%

In a similar manner, Table 135 shows retention data for Engineering majors in Fall 2000.

Table 135: Engineering Retention, Fall 2000

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Experimental</b>	3	2	0	0	2	66.7%
<b>PENS</b>	1	0	1	0	1	100%

In sum, 77.1% of successful students are retained as Science and Engineering majors, as shown in Table 136.

Table 136: Total Natural Sciences and Engineering Retention, Fall 2000

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Experimental</b>	93	72	0	2	74	79.6%
<b>PENS</b>	16	8	1	1	10	62.5%
<b>Total</b>	109	80	1	3	84	77.1%

Likewise, we analyze data obtained for Spring 2001. First, we consider Natural Sciences retention, shown in Table 137.

Table 137: Natural Sciences Retention, Spring 2001

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Experimental</b>	102	80	1	6	87	85.3%
<b>PENS</b>	37	26	0	3	29	78.4%

Table 138 shows retention data for the small number of Engineering majors in Spring 2001.

Table 138: Engineering Retention, Spring 2001

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Experimental</b>	5	1	4	0	5	100%
<b>PENS</b>	0	0	0	0	0	N/A

Combining the totals for Science and Engineering from Spring 2001, 84.0% of successful students are retained as Science and Engineering majors, as shown in Table 139.

Table 139: Total Natural Sciences and Engineering Retention, Spring 2001

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Experimental</b>	107	81	5	6	92	86.0%
<b>PENS</b>	37	26	0	3	29	78.4%
<b>Total</b>	144	107	5	9	121	84.0%

Lastly, data from Fall 2000 and Spring 2001 are merged for analysis. The summation is shown in Table 140.

Table 140: Total Natural Sciences and Engineering Retention, Experimental versus PENS

	<b>At start of Laboratory</b>	<b>Ending Science</b>	<b>Ending Eng.</b>	<b>Ending Pharm.</b>	<b>Total Retained</b>	<b>% Retained</b>
<b>Experimental</b>	200	153	5	8	166	83.0%
<b>PENS</b>	53	34	1	4	39	73.6%
<b>Total</b>	253	187	6	12	205	81.0%

$\chi^2$  analyses are then performed to compare the typical experimental and PENS groups to evaluate any differences between those groups with respect to retention as Science or Engineering majors. An  $\alpha$  level of 0.05 is selected. The null hypothesis is that there is no difference in the retention rate as Science, Engineering, and Pharmacy majors for students between the groups being compared. If the observed significance is less than 0.05, the null hypothesis is rejected in favor of the alternative hypothesis, which is that there is a difference in the retention rates between the students in the two courses. A summary of the retention data is found in Table 141.

Table 141: Summary of Retention Data, Experimental versus PENS

<b>Course * Retention Crosstabulation</b>				
Count				
		Retention		Total
		Not Retained	Retained	
Course	Experimental	34	166	200
	PENS	14	39	53
Total		48	205	253

The  $\chi^2$  analysis on the retention data is shown in Table 142.

Table 142:  $\chi^2$  analysis on Retention Data, Experimental versus PENS

Chi-Square Tests					
	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	2.416 <sup>b</sup>	1	.120		
Continuity Correction <sup>a</sup>	1.842	1	.175		
Likelihood Ratio	2.272	1	.132		
Fisher's Exact Test				.166	.090
Linear-by-Linear Association	2.406	1	.121		
N of Valid Cases	253				

a. Computed only for a 2x2 table

b. 0 cells (.0%) have expected count less than 5. The minimum expected count is 10.06.

Based on the observed significance for the Pearson Chi-Square, we fail to reject the null hypothesis and conclude that typical experimental students and PENS students are equally likely to be retained as Natural Sciences, Engineering, or Pharmacy majors.

## SUMMARY OF FINDINGS

In this course of this study, several groups of students were compared in hopes of understanding how the experimental course CH 204AV impacted them, both in terms of an immediate reaction to the course (by way of a survey) and in terms of a long-term effect as measured by subsequent enrollment patterns. Ultimately, five group comparisons were made on 5 sets of criteria. The findings are summarized in Table 143, below.

Table 143: Summary of Findings

<b>Group Comparison</b>	<b>Survey</b>	<b>Drop-Withdraw Incidence</b>	<b>Incidence of Chemistry and Biology Research Courses</b>	<b>Incidence of Upper Division Research Courses</b>	<b>Retention in Science and Engineering</b>
Control versus Experimental (random distribution)	No difference observed	No difference observed	No difference observed	No difference observed	No difference observed
Control versus Experimental (self-selected enrollment)	Differences on many survey items (in favor of Experimental course)	Less frequently in Experimental course	No difference observed	No difference observed	No difference observed
Control versus Experimental (same TA)	Difference on three survey items	No comparison possible	No difference observed	No difference observed	No difference observed
Control versus Experimental (different experimental instructor)	Difference on one survey item (in favor of Experimental course)	Less frequently in Experimental course	No difference observed	No difference observed	No difference observed
Experimental versus PENS	Difference on two survey items (in favor of Experimental course)	No difference observed	No difference observed	More frequently in Experimental course	No difference observed

### Survey Data

In general, wide differences in student opinion were only found in the primary comparison we wanted to make, that between the control group and the experimental group, as we defined them before. In other cases, relatively few differences were found, although one question that typically showed a difference was q52, “Would you recommend this course to a friend?” In each case in which a significant difference of opinion was found on this question, the experimental group responded more positively to this question.

## Drop-Withdraw Data

The incidence of dropping the control course was always higher than that of the experimental course. While in Fall 1998 a significant difference was not found, the semester-to-semester trend is suggestive of a pattern, as depicted in Figure 5.

Figure 5: Drops and Withdraws, by Group and Semester

For the primary comparison of control versus experimental, both with the original instructor and with the different instructor, a significant difference in the drop rate was found.

## Enrollment in Subsequent Chemistry and Biology Research Courses

No difference in the incidence of enrolling in a chemistry or biology research course was found in any of the comparisons we made. The data is presented graphically, by semester and group, in Figure 6.

Figure 6: Enrollment in Subsequent Chemistry and Biology Research Courses

### Enrollment in Subsequent Natural Sciences Upper Division Research Courses

The percentages of students of enrolling in upper division research courses was found to be the same for virtually all of the comparisons except for the comparison of typical students in the experimental group compared to PENS students also taking the experimental course. A histogram of the enrollment data is shown in Figure 7.

Figure 7: Enrollment in Upper Division Research Courses

### Retention in Science and Engineering Majors

No differences were found in the retention rates in Science, Engineering, or Pharmacy in any of the comparisons that were made as a part of this study. Retention data on a semester-by-semester basis is depicted in Figure 8.

Figure 8: Retention in Science, Engineering, or Pharmacy Majors

## **Chapter 4: Discussion**

This dissertation began with the proposition that General Chemistry laboratory courses should be taught in the manner that Liebig taught his beginning chemistry students: as an introduction to chemical research. Using Cognitive Apprenticeship Theory as a model for the processes in a chemical research environment, CH 204AV, this course was successfully taught at The University of Texas at Austin from Spring 1998 through Spring 2005. Having collected data during seven semesters in which this course was offered, we are now in a position to evaluate the Liebig-premise and to make recommendations for the future of laboratory instruction in chemistry. Five comparisons were made, and the conclusions of these comparisons are presented first here. Afterwards, the implications of these conclusions are framed in terms of the four research questions that were posed of the experimental course at the beginning of this dissertation.

### **GROUP COMPARISONS**

#### **Fall 1998: Control versus Experimental when the Groupings are Truly Random**

In this first semester in which the experimental course CH 204AV was taught to a larger audience, no difference was observed between the control and experimental groups in any of the variables we attempted to measure. While many individual survey items were suggestive of a difference between the two groups, the survey was only distributed to only four sections in the control group, and only 15 students in the control group completed the survey. The relatively small number of surveys received negatively impacted our ability to observe any difference between the control and experimental groups. Likewise, the drop and withdraw data also suggested a difference between the two groups (and, indeed, followed the general pattern observed in other semesters), but

we likely did not have enough subjects to observe any difference when using a  $\chi^2$  analysis necessitated by the nature of the analysis.

Another issue associated with this first offering of this course to a typical General Chemistry laboratory audience is that the course was still very much in development at that point; it was not a mature course as the control course was at that point. Possibly it was not until later that we would have been able to implement the ideas of Cognitive Apprenticeship in such a way as to receive any benefit from them.

The failure in observing any difference between the control and experimental groups at this point does cause some concern. Since beyond this point in time, students were aware of the existence of the experimental course or were simply assigned to the course, as in the PENS program, the obvious question of whether the experimental course met any of its goals given a random student enrollment is legitimate. However, as a pilot study in developing a new course for a larger audience, and given the *suggestion* (even if not fully realized or observed) that there may be some student benefit(s) in the new course, a wider offering and analysis of the experimental course followed in subsequent semesters.

### **Spring 1999 Onward: Control versus Experimental**

Beginning in Spring 1999, the catalog description of the experimental course included the phrase, “Intended for Life Science Students.” The inclusion of this phrase, with the intent of attracting students with a natural interest in the course material, allowed students to self-select the experimental course (or, the control course) if they observed the phrase. No doubt many students also did what one of the questions on the survey posed, “Would you recommend this course to a friend?”, which also would lead to some non-randomness in the students in the two courses. The effect of a non-random distribution of students in the control and experimental courses would make any analysis less reliable; as

a means of reducing this effect, a very strict standard of significance was chosen for survey items and the use of a distribution-free test statistic for the research course enrollment and retention data. The result of the nature of how students appeared in the control and experimental courses is that any conclusion drawn from the data should be approached with some caution.

However, if students signed up for the experimental course as a result of their *interest* in the focus on life sciences, one might expect to observe differences in key “Interest” questions posed in the survey. Indeed, on 2 of the 9 “Interest” questions, a difference is observed, and perhaps it is telling that q40, “Chemistry in Medicine” is one of these two, in favor of the experimental course. The other “Interest” question in which a difference was observed was q34, “Studying Chemistry in General.”, perhaps a measure of the general appeal of the content of the experimental course. “But the failure to observe any difference in all of the other “Interest” questions causes us to wonder: aside from the *content* of the experimental course that would appeal to a segment of the General Chemistry laboratory audience and thus may have led to some imbalance in terms of the number of life science students (and, as a consequence, in other areas as well) in the two courses, were the students in the two groups different at the beginning of their General Chemistry laboratory experience?

Evidence supporting the idea that the control and experimental group were not different at the onset of their laboratory experience comes from the research course enrollment and, particularly, retention data on the two groups. No differences were found between the two groups in either of these factors. These results suggest that students in the two courses were equally capable of success in their General Chemistry laboratory course, and any differences observed in them during the time of their General Chemistry laboratory experience must be attributable to something within their laboratory course.

This observation provides us confidence that analyses between the control and experimental groups are appropriate.

While relatively few differences were found in “Interest” questions between the two groups, on 8 of the 9 “Confidence” questions, a significant difference is observed. Notably, in all of the “Confidence” questions which addressed chemistry specifically (understand key concepts of chemistry, solve chemistry problems, understand the chemistry underlying lab experiments, visualize key concepts of chemistry, apply your knowledge of chemistry to the real world, success in another chemistry course, succeed in a chemistry-related discipline), the experimental group responded more positively. This series of responses, taken together, suggests that a carefully-constructed laboratory experience can enhance student confidence in the subject at hand. A significant difference was also found in “Confidence” in the ability to “perform lab experiments” in favor of the experimental group, likely due to the structure of the experimental course: students performed experiments that were related to each other and could approach each laboratory session with the expectation that they had some experience in the chemistry at play. The only question in which no difference was found in “understand other areas of science”, understandable because students recognize success in one area of science does not immediately suggest success in other areas. The large number of differences within “Confidence” questions suggests that something within the structure of the experimental course provides students with the confidence in being able to succeed in their General Chemistry laboratory course.

Additional evidence that the experimental course enhanced confidence in being successful comes from drop-withdraw data. In every semester in which this study was performed, a smaller percentage of students dropped or withdrew from the experimental

course as compared to students in the control course. This difference was shown to be statistically significant in the comparison of control students with experimental students.

Among the remaining survey questions, students in the control group and experimental group responded in a similar fashion (no observed difference) to questions addressing the lecture component of the laboratory course (Impact on Learning, Impact on Confidence, Impact on Enthusiasm, I enjoyed the lectures, the organization of the lectures was important for my learning). Clearly, the laboratory experience itself, and not the lecture associated with the laboratory experience, differentiates the control and experimental groups. Students in the experimental group responded more positively to statements about the applications of chemistry in the course (made certain concepts easier to understand, made learning interesting), perhaps due to the life-science focus of the class. Other questions addressing various components of the course experience (wet lab, exams, quizzes, homework/exercises) all favored the experimental course.

In the end, it appears to be the laboratory experience itself that caused students to report higher confidence in being able to be successful. All questions addressing the nature of the laboratory experience (I enjoyed the labs, I understood the chemistry behind the labs before I did them, eventually I understood the chemistry behind the labs, the labs helped me understand important concepts in the course, enough time was allowed for labs) displayed a significant difference in response between the two groups, all in favor of the experimental course. The survey culminates in a question that pursues the general value of the laboratory course, "Would you recommend this course to a friend?" Students in the experimental course respond to this question with a resounding yes, while students in the control course are equally negative.

### **Does the Teaching Assistant Make the Difference? Control versus Experimental when the Same TA Teaches Both Courses**

In Spring 2000, one teaching assistant was assigned to teach one section of the control course and one section of the experimental course. Ordinarily, this arrangement would be viewed as being undesirable for the graduate student assigned to be a teaching assistant as it requires preparation for two courses instead of the conventional one. This unusual arrangement allowed us to consider the impact of the teaching assistant (TA) has on the course. Central to the idea of teaching a course using the Cognitive Apprenticeship model is that an expert provides his/her experience in terms of the thought processes required to complete cognitive tasks, such as designing laboratory experiments. Since in the laboratory course, the primary contact for the students is the TA, the TA bears a great deal of responsibility for making the approach work. Unfortunately, however, this arrangement only happened in one semester and as such, a relatively small number of students (20 in each group) were involved in this aspect of the CH 204AV laboratory assessment.

In the end, very little difference was observed between the control and experimental students with regard to the variables we chose to study. Given the relatively small number of students involved, it is not surprising that we were not able to discern any differences in the subsequent enrollment patterns of the students in the two courses. Additionally, no student dropped or withdrew from either of the courses, which made impossible a comparison of the incidence of dropping out of the laboratory course. The survey demonstrated a difference on 3 questions, two in favor of the experimental course (“Confidence in your ability to succeed in a chemistry-related discipline” and “The applications of chemistry discussed in this course made certain concepts easier to understand”), both of which were observed in the larger control versus experimental comparison, and one in favor of the control course, “Interest in chemistry in Industry”,

which was not observed before. The difference in response on this one question is difficult to explain; perhaps it is due to some atypical distribution of students in the two sections under study. As only 30 surveys were completed between the two groups, it is conceivable that we simply did not have enough subjects to really observe the differences between the two groups that were observed before.

However, taking the survey analysis at face value, another explanation is that there was no difference between the control and experimental groups under this TA's supervision. This conclusion would be at odds with the difference in the two groups that we observed before and highlights an important point about trying to change the way laboratory courses are taught: teaching a course according to the principles of Cognitive Apprenticeship requires discipline and some experience as an instructor. No doubt we never realized all of the benefit of teaching the experimental course in this manner since we were reliant on (in many cases, including this one) relatively inexperienced teaching assistants. It is not difficult to imagine the teaching assistant in charge of the two sections at hand approaching them in a very similar, if not identical, manner. Any difference we might have observed would be primarily due to some factor(s) other than the pedagogical approach of the TA, perhaps the structure of the course or the influence of other people involved in the course. If we had been able to perform a comparison between the two courses with the same, more experienced, TA several other times in an effort to increase the number of subjects, we might have been able to draw a better conclusion on how large a role the teaching assistant played in the apparent success of the experimental course. As it is, this question remains largely unresolved.

### **The Effect of the Instructor: Control versus Experimental when a Different Instructor Teaches the Experimental Course**

In Fall 2000, as part of a study to assess the long-term viability of the experimental course, the head teaching assistant assumed the responsibility of teaching

the experimental course, although the original instructor, having a faculty appointment, remained on as the instructor of record for the course and acted in a supervisory manner. In many ways, the parameters that we considered in comparing the control and experimental courses provided us with the same results as before: a significant difference was found in the drop rates, with students in the control course being more likely to drop their laboratory course as compared to students in the experimental course, and no difference was found in the incidence of enrolling in subsequent research courses or in the retention rate in Science and Engineering. On the survey, a difference was found in only one of the questions, which was a question in which a difference was ordinarily observed, “Would you recommend this course to a friend?” Given that 74 surveys were completed, enough surveys should have been collected to observe a difference between the two groups, and the lack of difference between the two groups is suggestive that the identity of the instructor is important.

Indeed, even as the experimental course was being taught, the instructional staff felt that the experimental course had lost some of the richness that it had under the original instructor. The original instructor of the course had spent the bulk of his career in the content area of the experimental course and consequently was able to add personal experience and anecdotes to the lecture portion of the laboratory course; while the head teaching assistant was able to competently convey the content of the experimental course, the lecture portion of the course became less personal and more sterile. One of the great strengths of the experimental course, the relation of the laboratory course to the personal real-life work experience of the instructor, was lost in the process. With a weakened link to the “real world”, the situated learning which is an element of Cognitive Apprenticeship theory becomes weakened as well, and subsequent benefits from teaching this course in this manner would be minimized. In this context, it is not difficult to imagine students in

the experimental course not reporting higher “Confidence” or “Interest” on various survey items as compared to students in the control course. The structure of the experimental course, however, remained intact. That structure likely accounts for the difference in drop rates between the two courses and the difference in response on the one survey question.

This particular aspect of the experimental course experience was evaluated in the fall. Students taking the laboratory course in the fall were taking it either (at least) one semester behind their General Chemistry lecture experience or were taking it concurrently with their second-half portion of General Chemistry, in which case they would be taking General Chemistry one semester late relative to the “typical” student. Our experience suggested that students taking General Chemistry laboratory in the fall were not as academically strong as students taking laboratory in the spring, and it is conceivable that the lack of difference we observed on the survey may be indicative of subtly different student group in the fall semesters. Notably, in the comparison of students in Fall 1998, no difference was observed on the survey between the control and experimental groups at that time as well with the original instructor of the experimental course in place. To fully assess the impact of the instructor on the experimental course, an experiment in a spring semester should have been performed in order to evaluate any difference between semesters. However, our “gut feeling” at the time told us that the experimental course was diminished by the change in instructor, even without the survey analysis in hand, and so this aspect of the experimental course experience was not repeated.

### **The Effect of the Experimental Course on an At-Risk Student Group**

In Fall 2000 and again in Spring 2001, the experimental course was chosen as the General Chemistry laboratory experience for students in the Partnership for Excellence in

the Natural Sciences (PENS). Participants in the PENS program were primarily first-generation college students who had attended high schools traditionally underrepresented at The University. As such, these students were perceived as being at-risk. Special sections of introductory courses in Natural Sciences, such as General Chemistry, were arranged for these students in an effort to place them in smaller classes in the hope of increasing interactions between PENS students with each other and with University faculty. Additionally, a tutor was designated for each course within the PENS suite of introductory courses so that students had an additional instructional resource available to themselves that other students within The University ordinarily would not have. Prior to Fall 2000, no General Chemistry laboratory section was set aside for PENS students and PENS students were individually placed in different sections of the control laboratory course. This arrangement was ultimately viewed as being unsuitable by the College of Natural Sciences, and as testament to The University's high regard for the experimental course, sections of the experimental course were chosen to host PENS students.

Regrettably for purposes of this study, no sections of the control course were ever designated for PENS students. To best draw a conclusion about the impact of the experimental course on different student groups, a comparison between PENS students in the control course with PENS students in the experimental course should have been arranged. This comparison was beyond our capability to organize. Instead, to evaluate the impact of the experimental course on student groups, a comparison between "typical" experimental course students and PENS students in the experimental course is presented here.

Students in the PENS group presented a new challenge for the experimental course. A fair question at the outset was if PENS students could be successful in the experimental course. Comparing the drop and withdraw rates between "typical"

experimental students with their PENS counterparts shows no difference between the two student groups. However, an inspection of the grade distribution in Table 120 shows that “typical” students in the experimental group received higher marks than PENS students, consistent with the idea that PENS students were somewhat academically weaker than typical students at The University. The important observation here, though, is that PENS students were as likely to finish their laboratory course successfully as other University students.

With respect to subsequent enrollment in research courses, PENS students appear to be less likely to take upper division research courses than other students in Natural Sciences and Engineering at The University. As, typically, only advanced undergraduate students might pursue a research project, this pattern may be the result of PENS students, on average, being academically weaker than “typical” students.

The survey demonstrated differences on two questions: q51, “Enough time was allowed for labs”, and q52, “Would you recommend this course to a friend?”, with “typical” students in the experimental course responding more favorably to these items. PENS students evidently found the experimental course challenging and likely struggled to understand the concepts behind the laboratory exercises; their struggle with respect to time required to conceptualize laboratory processes and overall impression of the experimental course is reflected in their responses to these two questions. Notably, however, no difference was found on the “Interest” and “Confidence” questions between the two groups, perhaps suggestive of the idea that the same benefit of enhanced confidence afforded to the “typical” experimental students was provided to PENS students as well. Without a comparison of the control course to the experimental course for PENS students, though, this idea remains speculative.

## **OVERALL CONCLUSIONS**

At this point, it is instructive to reframe the experience of the experimental course in terms of the four overall research questions posed of it early in this dissertation. The experimental course itself, with a renewed focus on the value of the laboratory experience, and variations on the experimental course (in terms of the instructional staff and population it serves) provides us some insight on how the laboratory experience impacts students and what the role of the laboratory might be. An analysis of the four research questions follows here.

### **Interest in Science**

The first research question asked if students in the experimental course are more likely to become interested in science as a result of their enrollment in the course. The experimental course was designed to appeal to and meet the needs of life science students taking a General Chemistry laboratory course. Given the greater appreciation of the importance of chemistry to understand and explain biological phenomena, it was not unreasonable to structure an introductory chemistry laboratory course with the life sciences in mind. By focusing on chemistry relevant to students in the life sciences, we anticipated that the students in the experimental course might report enhanced interest in chemistry and in the sciences in general. This expectation is partially borne out by the comparison of control and experimental students as the survey data show a difference in two interest questions: studying chemistry in general and chemistry in medicine. The enhanced interest in studying chemistry in general is an encouraging result, not easily explained by a previous interest in chemistry as it pertains to life sciences, and may be directly due to the influence of the course: tailoring an experience to a students' perceived interest may heighten interest in the subject area in general.

However, in none of the other interest questions was a significant difference found. No difference was found between the control and experimental groups on questions addressing the issue of a career in chemistry (q36, pursuing a chemistry-related major) or in science (q37, pursuing a science-related field) or interest in science in general (q42). It appears as though students enjoyed the application of chemistry to their perceived interest at the time of taking the experimental course but did not anticipate it impacting their ultimate career choice.

This aspect of the survey data is echoed in the long-term effects of the General Chemistry laboratory experience. We find that students are no more likely to pursue research courses in the sciences nor be retained as science and engineering majors as a result of having taken the experimental course. Each of these results suggests that the experimental course was not able to increase the level of interest in science and engineering in students relative to students in the control course. However, there may be a limit to the number of available research spaces, and if one exists, may cause us not to be able to see any difference in student *desire* to enroll in those research courses. Notably, the same percentage (16.4%) of students in both the control and experimental courses pursued a research course after their General Chemistry laboratory experience, suggestive of the idea that all of the available slots were occupied. Confounding the issue, other factors, such as interest in the lecture course (if one exists) may be equally important, if not more so, in confirming a student's desire to continue along a path towards a career in the sciences.

Even if students may not have become more interested in a science career as a result of having been enrolled in the experimental course, the observation that students appear to enjoy a selection of experiments customized to their perceived interest and do not appear to be negatively impacted by the choice in the long term is an important one.

This observation frees instructors to design laboratory courses around whatever chemistry they feel can be interesting to (and appropriate for) introductory students and have instrumentation and equipment to support. Indeed, it may be that the most important factor in eliciting student interest may be a laboratory course which draws from the instructor's own career experience. In such a course, students can feel the excitement inherent in scientific discovery both for themselves and vicariously through the instructor. However, to share this scientific journey with students, the course has to be structured in the same way that the instructor follows in his/her own line of work. Students in the experimental course reported higher interest in studying chemistry in general as a result. The obvious implication of this observation is that *any* content, within any overlap of instructor experience and student perceived interests, may be suitable for introductory chemistry laboratory courses as long as that content is accessible to introductory students and if it is structured in a way that follows the natural rhythm of chemical research.

In comparing typical students in the experimental group with the PENS group, we find no difference in how students respond to survey items related to interest and little difference in terms of their incidence of retention in Science, Engineering, or Pharmacy or enrollment in research courses. PENS students are less likely to pursue upper division research courses, but this may be the result of their having a much more structured program than other undergraduates. It appears, in terms of interest in chemistry and science in general, that PENS students in the experimental course are very much like other undergraduates who took the experimental course.

### **Confidence in Success**

The second research question asked if students in the experimental course are more likely to feel that they can be successful in a science career. Students play out the beginning stages of their careers in introductory courses such as General Chemistry

laboratory. An important lesson these courses teach them, among other things, is what career paths are viable options for them. If a student feels that he/she may be unsuccessful in a course, it may be because he/she has either not made the requisite effort to be successful, a condition which is reparable, or may have little aptitude in the area, which is a more difficult problem to solve. Whatever the cause(s), students have an “out”: they may elect to drop these courses. In laboratory courses, however, students reasonably expect to finish the course successfully if they only come to class and meet the requirements of the course, since evaluation in laboratory instruction is largely based on performance in the laboratory setting. It seems reasonable then that laboratory courses should not have large drop rates, unless students are performing poorly in the associated lecture course (if one exists) and they are required to drop the laboratory course. In fact, the experimental course and the control course each have a relatively small attrition rate (4.9% and 8.7%, respectively, in the overall comparison of control versus experimental). In every semester in which a comparison between the control and experimental course was made, the drop rate in the experimental course was always lower, as shown in Figure 5. If students are dropping one laboratory course more frequently than the other, there must be an underlying cause. The lower drop rate in the experimental course could be interpreted as a higher level of confidence in finishing the laboratory course successfully, as compared to the control course. The survey data reinforces this hypothesis. The survey indicates a generally positive feeling towards the experimental course, particularly in the area of student confidence, in which virtually every (with one notable exception as described before) item within the Confidence section indicated higher confidence among students in the experimental course. The survey data also demonstrate that students in the experimental course would be more willing to recommend the course to a friend.

Taken together, these factors may merely be a reflection of the general feeling of confidence that students had about the laboratory experience in the experimental course.

This enhanced feeling of confidence is no doubt brought about by the structure imposed by the Cognitive Apprenticeship model. While it is likely that we were not able to derive all of the benefits that the model provides in that our teaching assistant “experts” were (mostly) beginning graduate students with limited teaching experience, the underlying structure of the course necessitated by the model certainly added to the feeling of confidence that students in the experimental course evidently felt. The experiments were designed to follow the natural rhythm of chemical research by focusing on a narrow problem in depth, rather than having a series of unrelated experiments, as would be common in a typical General Chemistry laboratory course. Each week’s experience in the experimental course drew something from all of the previous work in the course, so that students could feel as though they were applying old knowledge to new problems. The process can be described as a spiral: starting with a small, central idea, students built upon their experience not only upward but outward as new, related ideas were introduced. This iterative process naturally encourages confidence in being able to understand and succeed in chemistry, not only because students worked from a position of experience in each week’s experiment, but also because they knew they were performing experiments much as a practicing chemist would in the course of his/her work.

The higher level of confidence students felt benefited not only the students in the experimental course, but the University as well. A lower drop rate positively impacts the University’s finances, as fewer resources (not only in the cost of chemicals, disposal, and laboratory equipment, but also in personnel and space utilization) are consumed.

### **Enrollment in Research Courses**

The third research question investigates if students in the experimental course are more likely to pursue further research courses. The experimental course was created in the anticipation of attracting a larger number of students into pursuing research, as evidenced by taking a research course, later in their academic careers. The longitudinal data obtained suggest that this expectation was not realized; students in the experimental and control courses were equally likely to take research courses later. Several factors may account for this result. The number of research positions available at The University has a natural limit, and not every student who may be interested in pursuing research may have the opportunity to do so, as described earlier. Within the Department of Chemistry and Biochemistry, in particular, the few research positions that exist for undergraduates are likely to be offered to chemistry majors, who ordinarily would not have taken either the experimental or control courses, but rather a laboratory course designed especially for chemistry and chemical engineering majors. There simply may not have been a large enough number of students able to pursue a research course to perceive any difference in the incidence of their doing so.

### **Persistence as Science Majors**

The final research question posed asked if students are more likely to persist as science majors as a result of having been enrolled in the experimental course. Engaging students in research is commonly believed to be a powerful recruiting tool for many disciplines, including chemistry. With this idea in mind, we expected that the experimental course would ultimately lead to higher retention in the sciences and engineering relative to the control course. The longitudinal data obtained, however, do not support this expectation, as no difference in science and engineering retention is found between students in the experimental and control groups. Important to this result,

of course, is that the research experience in which the experimental group participated was in the context of a standard introductory laboratory course; they did not have access to the personalized attention that a handful of advanced undergraduate students under a faculty mentor have. Thus, if it is because of the larger personal investment that faculty must make in each research student that makes the research experience more powerful, the effect would be diminished in a standard laboratory course involving a large number of students, no matter how well designed or intentioned the course was.

Achievement in the lecture course rather than in the laboratory course might be an important factor in determining which introductory students may be retained as science or engineering majors. Laboratory courses typically have small attrition rates and high grade distributions and as such may not provide much feedback to students regarding their ability to be successful in a chosen field. The problem here may be one of perception: laboratory courses should provide students with some expectation of what work in different fields is like and hence might provide some justification to select one career track over another. Introductory students may not have enough experience to appreciate this point of view. Perhaps only after a few years of study in an area can students make a mature judgment in this regard.

#### **SUGGESTIONS FOR FUTURE WORK**

While this study has provided some insight into the nature of the laboratory experience on students, some questions remain unresolved. Here we propose some ideas for future work to build upon what we have discovered.

The study, as conceived and carried out, was strictly quantitative, *i.e.*, we only looked at measurables: survey responses and numbers of students in one condition or another. While such study designs can be instructive, often they cannot provide much information on *why* a particular phenomenon occurs. The study would have benefited

from a qualitative component, in which some students were interviewed, in order to further understand some of the observations we made. In particular, we do not know, from the data collected, whether the confidence in the ability to be successful the students in the experimental course reported persisted beyond the timeframe of the laboratory course. Measures of confidence were established during the time students were enrolled in the laboratory courses under study; although any initial feeling of confidence may have been helpful to students while they were taking these laboratory courses, it is unknown whether students carried this confidence into later courses. Of particular interest would be whether students taking research courses later in their careers would still feel this confidence brought on by their introduction to laboratory work in chemistry; if so, the experimental course will have served an important purpose in these students' professional development. Interviewing these students would likely be very instructive.

Additionally, beyond the sheer numbers of students who pursued a research course later in their careers, there is the question of how well they were prepared for such an experience. Students in the experimental course should have been at an advantage relative to the students in the control group in this regard, as their course was designed with this goal in mind. However, little is known of how well any of these students felt prepared for advanced research once they reached that point in their academic careers. A follow-up study, in which students in both the experimental and control groups would be interviewed on their impressions of the advanced research experience, may provide some insight on the effectiveness of the research-based introductory chemistry laboratory toward preparing students for later research work. If students are better prepared for research as a result of having been taught using this method, the approach will indeed be justified, even if larger numbers of students do not participate in that research.

The study also left out a group of students who may have been useful to include: those who were in the lecture course but who were not in an associated laboratory course. While these students are obligated to eventually take the introductory laboratory course if they remain in a science-oriented track, a comparison of survey responses between students who were either enrolled in laboratory or not as they took the associated lecture course could determine if laboratory courses act as a means to interest students in a science career. Conceivably, both laboratory courses could have acted in this way for students, just equally so, but since the comparison was made between the two courses without the benefit of a baseline of no laboratory instruction at all, we do not currently know if the two laboratory courses might have increased interest in a science career for the two groups of students.

The survey instrument was not validated, and it may not have been capable of detecting some of the affective characteristics it was intended to measure. However, since the survey data and the longitudinal data obtained pointed to the same conclusions, the survey instrument appears to be reliable for this particular study. Still, a validated survey instrument designed to measure affective characteristics such as interest, confidence, *etc.*, would be a very valuable tool for future work, given a great deal of the value of the laboratory experience for students appears to be in the affective domain.

A wider study of the impact of the teaching assistant on the experimental course would have been useful; as the primary instructional contact for students at a large institution such as The University of Texas at Austin, the teaching assistant undoubtedly plays an important role in a student's laboratory experience. A more experienced instructor, one who can approach different courses in different ways, would be required to make a better assessment of this factor.

## SUMMARY

The chemistry laboratory experience is perhaps unique among all courses that students pursue in higher education. The memory of the laboratory course remains vivid in the minds of students who take it well after the experience is over, even for those students who ultimately pursue career paths outside of the sciences. Whether it is because of the hands-on approach laboratory work always involves, the feelings of success and failure, the camaraderie of working in the laboratory with other students, the one-on-one contact with the instructor of the laboratory, or some combination of all these things and perhaps more, the laboratory course represents the nature of chemistry to the students who have the opportunity to take it. The world of chemistry does in fact contain these elements, and in this way the laboratory course does accurately reflect the nature of chemistry. What remains is to make the *work* of the teaching laboratory authentic and true to the nature of chemistry as well.

One of the common rationales for laboratory instruction is that it exists to support instruction in the lecture component of the course, as H.I. Schlesinger argued, “to illustrate and clarify principles discussed in the classroom, by providing actual contact with materials.”<sup>10</sup> In fact, many laboratory courses are designed with this idea in mind, with laboratory experiences coordinated in time with lecture topics. As the lecture course is an overview of many topics, this approach necessitates a “cafeteria-style” laboratory course in which many apparently unrelated laboratory experiences are “cobbled together” into one course. The control laboratory course in this study was designed to follow this very common scheme. The experimental laboratory course, being research-based and with a focus on a narrow topic, could not be taught under the cafeteria-style approach of traditional laboratory instruction. The experimental course in this study was instead designed to be a stand-alone course, with very little reference to the associated lecture. It

would seem then that students in the control course would see connections to the lecture course whereas students in the experimental course would not. In the few semesters in which this question was specifically addressed, students in the control group were not more likely to say that “the labs related well to the CH 302 lecture material.” This may simply be related to the already established literature precedent that laboratory content does not appear to improve student performance in the lecture<sup>29–34</sup>: students apparently compartmentalize their learning and do not readily connect laboratory and lecture concepts.

While this observation may be perceived as deeply discouraging, it also provides an opportunity: students are not likely to be harmed by choosing experiments that are not immediately related to lecture material. Indeed, if the survey responses are accurate, students in the experimental course were not at a disadvantage in the lecture course relative to students in the control course. If this is so, instructors should not feel bound to the canon that laboratory exercises need be chosen based on lecture topics; the laboratory, evidently from the student’s point of view, is an entirely separate course. Indeed, for courses involving large numbers of students, the coordination of lecture and laboratory topics become extremely difficult from a logistic point of view and the two components become separate courses, *de facto*. Once instructors accept this point of view, it provides them an opportunity to take on innovative approaches to laboratory work; freed of the imposed (and artificial) time constraints from the lecture course, instructors can pursue projects with students, allowing them to experience first-hand how chemists approach problems to which chemistry can provide answers. The chief benefit of this point of view to instructors is that they can structure laboratory courses based on their own experience as chemists, providing the “personal touch” that is part of any mentor/mentee relationship. This approach strikes at the heart of chemical research, which is likely to be

more intellectually stimulating than a series of experiments performed by rote, not only to the instructor, but certainly also to the student. Perhaps students in the experimental course indicated as much when they reported more interest in studying chemistry in general.

The failure of students to make a connection between the lecture and laboratory course is telling. Students are reminding us that the two venues in which chemical knowledge is attained are indeed different. The lecture course is not unlike a history course; it documents what we already know about the discipline and how we came to know it. The laboratory course also has this character, but it also holds the promise of revealing what we do not yet know. It is this ability that makes the laboratory course unique and powerful, and ultimately, true to the nature of chemistry. Chemistry, in Liebig's time and in ours, continues to be the science of transformation and change, reflected not only in the phenomena chemists study, but indeed in the discipline itself. It will continue to be so for all generations which follow us. Laboratory courses do chemistry a disservice when they cannot be the mechanism for change, for in the end, they are the only means that chemistry can rely on to play that role.

It may be that the most important role of the teaching laboratory is to prepare the next group of students to be chemistry's agents of change. Having them skilled in the ability to do research, as Liebig found nearly 200 years ago, is the most reliable way to make sure the work of chemistry goes on. The experimental course in this study showed that introductory chemistry students can be successful in a research-based laboratory program and, from it, derive a feeling a confidence about their ability to perform laboratory experiments. Furthermore, the benefits of such a laboratory program are attainable by all students, including those who might be considered at-risk. As the

students in the experimental course look forward to the future with confidence, the laboratory experience has served its purpose well.

## **Appendix A: Spring 1998 and Fall 1998 Survey**

### **End of Semester Alternate CH204 Course Survey<sup>1</sup>**

#### **Chemistry 204 Consent Form for Students**

Dr. Kent Stewart is conducting a survey of all the students completing the Alternate CH204. The survey is designed to assist Dr. Stewart in understanding the effects of various course innovations on students' learning experiences and may lead to improvements in the teaching of chemistry nationwide.

The survey should take about ten minutes to complete. All student responses will be held strictly confidential. Dr. Stewart will generalize about student responses so as to obscure the identity of any particular students before reporting any survey findings. Dr. Stewart may publish papers based on the results of this survey, but these materials will contain no information that would identify particular students.

Participation is completely voluntary. (Students choosing not to participate may simply return a blank survey). Refusal to participate will have no effect on your grade. There are no formal benefits or risks associated with participation.

Any questions you have you may ask now, or you may call Dr. Kent Stewart at 471-7732. I have read the above and give my consent to participate in the study.

**Signature** \_\_\_\_\_ **Date** \_\_\_\_\_

**STUDENT I.D. number** \_\_\_\_\_

**(Do not put your student I.D. on the upper left corner of the "bubble" sheet)**

Dr. Stewart thanks you for participating in this survey. The questions in the survey are intended to help him understand your experiences in alternate CH204. Your thoughtful responses to the questions in this survey will help him to evaluate and improve the course offering.

Extra copies of this consent form can be obtained at front of the room where this class is being held.

---

<sup>1</sup> This form is modified from one developed by The Learning through Evaluation, Adaptation and Dissemination (LEAD) Center, University of Wisconsin Madison for the education reform project, "New Traditions: Revitalizing the Curriculum" as taken from their web site on April 20, 1998.

## Appendix B: Spring 1999 Survey

### Introductory Chemistry Laboratory Course Survey<sup>1</sup> Consent Form for Students

Dr. Kent Stewart and Mike Elliott are conducting a survey of all the students completing introductory Chemistry laboratory courses at the University of Texas. The survey is designed to assist us in understanding the effects of various course innovations on students' learning experiences and may lead to improvements in the teaching of chemistry nationwide.

The survey should take about ten minutes to complete. All student responses will be held strictly confidential. We will generalize about student responses so as to obscure the identity of any particular students before reporting any survey findings. We may publish papers based on the results of this survey, but these materials will contain no information that would identify particular students. Participation is completely voluntary. (Students choosing not to participate may simply return a blank survey). Refusal to participate will have no effect on your grade. There are no formal benefits or risks associated with participation. Any questions you have you may ask now, or you may call Dr. Kent Stewart or Mike Elliott at 471-7732. I have read the above and give my consent to participate in the study.

Signature \_\_\_\_\_ Date \_\_\_\_\_

STUDENT I.D. number \_\_\_\_\_

(Do not put your student I.D. on the upper left corner of the "bubble" sheet)

Dr. Stewart and Mike Elliott thank you for participating in this survey. The questions in the survey are intended to help us understand your experiences in alternate CH204. Your thoughtful responses to the questions in this survey will help us to evaluate and improve the course offering.

Extra copies of this consent form can be obtained at front of the room where this class is being held.

**Please Answer: The two most important aspects of this course for my learning were...**

1)

2)

Please fill in your responses on the separate bubble sheet

## Appendix C: Fall 1999, Spring 2000, and Fall 2000 Survey

### Introductory Chemistry Laboratory Course Survey<sup>1</sup> Consent Form for Students

Dr. Kent Stewart and Mike Elliott are conducting a survey of students completing introductory Chemistry laboratory courses at The University of Texas. The survey is designed to assist us in understanding the effects of various course innovations on students' learning experiences and may lead to improvements in the teaching of chemistry nationwide.

The survey should take about fifteen minutes to complete. All student responses will be held strictly confidential. We will generalize about student responses so as to obscure the identity of any particular students before reporting any survey findings. We may publish papers based on the results of this survey, but these materials will contain no information that would identify particular students. Participation is completely voluntary. (Students choosing not to participate may simply return a blank survey). Refusal to participate will have no effect on your grade. There are no formal benefits or risks associated with participation. Any questions you have you may ask now, or you may call Dr. Kent Stewart or Mike Elliott at 471-7732. I have read the above and give my consent to participate in the study.

## Appendix D: Spring 2001 Survey

### Introductory Chemistry Laboratory Course Survey<sup>1</sup> Consent Form for Students

Dr. Kent Stewart and Mike Elliott are conducting a survey of students completing introductory Chemistry laboratory courses at The University of Texas. The survey is designed to assist us in understanding the effects of various course innovations on students' learning experiences and may lead to improvements in the teaching of chemistry nationwide.

The survey should take about fifteen minutes to complete. All student responses will be held strictly confidential. We will generalize about student responses so as to obscure the identity of any particular students before reporting any survey findings. We may publish papers based on the results of this survey, but these materials will contain no information that would identify particular students. Participation is completely voluntary. (Students choosing not to participate may simply return a blank survey). Refusal to participate will have no effect on your grade. There are no formal benefits or risks associated with participation. Any questions you have you may ask now, or you may call Dr. Kent Stewart or Mike Elliott at 471-7732. I have read the above and give my consent to participate in the study.

**Signature** \_\_\_\_\_ **Date** \_\_\_\_\_

**Circle your laboratory enrollment:**

CH 204          CH204AV          CH317

Dr. Stewart and Mike Elliott thank you for participating in this survey. The questions in the survey are intended to help us understand your experiences in your General Chemistry laboratory course. Your thoughtful responses to the questions in this survey will help us to evaluate and improve course offerings.

Extra copies of this consent form can be obtained at front of the room where this class is being held.

Lab Survey April 30, 2001

---

<sup>1</sup> This form is modified from one developed by The Learning through Evaluation, Adaptation and Dissemination (LEAD) Center, University of Wisconsin Madison for the education reform project, "New Traditions: Revitalizing the Curriculum" as taken from their web site on April 20, 1998.

**Please Answer: The two most important aspects of this course for my learning were...**

1)

2)

**The three things that helped me most in getting through this course were...**

1)

2)

3)

**The survey continues on the following page:**

**Please fill in your responses on the separate bubble sheet**

**BACKGROUND:**

**1) Chemistry lab enrollment**

	fill in...
CH 204	1
CH 204 AV	2
CH 317	3

**2) Wet Lab Day: for...**

	fill in...
TUESDAY (OR TUESDAY/THURSDAY)	1
WEDNESDAY (OR MONDAY/ WEDNESDAY)	2
THURSDAY	3
FRIDAY	4

**3) Wet Lab Time:**

for...	mornings	afternoons
fill in...	1	2

**4) Major:**

for...	fill in...
CHEMISTRY AND BIOCHEMISTRY	1
LIFE SCIENCES, HEALTH SCIENCES, BUT NOT BIOCHEMISTRY	2
ENGINEERING, INCLUDING CHEMICAL ENGINEERING	3
ALL OTHER SCIENCES, INCLUDING PHYSICS AND COMPUTER SCIENCES	4
ALL OTHER MAJORS	5

**5) sex:**

for...	female	male
fill in...	1	2

**6) U.S. ethnic codes for...**

	fill in...
WHITE (NOT HISPANIC) OR OTHER	1
ASIAN OR PACIFIC ISLANDER	2
AMERICAN INDIAN OR ALASKAN NATIVE	3
HISPANIC/LATINO	4
BLACK/AFRO-AMERICAN	5

**7) college rank:**

for...	freshman	sophomore	junior	senior	all other situations
fill in...	1	2	3	4	5

**8) semesters of high school chemistry: 1 2 3 over 3 ( fill in bubble 4 ) none (fill in bubble 5)**

**9) semesters of college level chemistry completed: 1 2 3 over 3 (fill in bubble 4) none ( fill in bubble 5 )**

Please rate your **CONFIDENCE** levels in the areas below.  
**(Fill in a number on the bubble sheet for each row.)**  
**CONFIDENCE IN YOUR ABILITY TO...**

		confidence level				
		low				high
understand key concepts of chemistry.....	<b>10)</b>	1	2	3	4	5
solve chemistry problems.....	<b>11)</b>	1	2	3	4	5

working with others to learn science.....	<b>23)</b>	1	2	3	4	5
chemistry in industry.....	<b>24)</b>	1	2	3	4	5
chemistry in the environment.....	<b>25)</b>	1	2	3	4	5
chemistry in medicine.....	<b>26)</b>	1	2	3	4	5
science in general.....	<b>27)</b>	1	2	3	4	5

**28) When did you take CH 302 (or its equivalent)?**

THIS TERM (SPRING 2001)  
 LAST TERM (FALL 2000)  
 SUMMER 2000  
 PRIOR TO SUMMER 2000  
 I PLACED OUT OF CH 302

**Fill in...**

**1**  
**2**  
**3**  
**4**  
**5**

		No/ not at all				Yes/ very much so
Did your General Chemistry lecture experience help you in your laboratory course?.....	<b>29)</b>	1	2	3	4	5
Did you use the General Chemistry textbook to help solve problems in your laboratory course?.....	<b>30)</b>	1	2	3	4	5
Do you see value in taking laboratory courses?.....	<b>31)</b>	1	2	3	4	5
How closely do the skills presented in this lab match your academic and/or career goals?.....	<b>32)</b>	1	2	3	4	5

**33) Would you recommend this course to a friend?**

no					highly recommend
1	2	3	4	5	

For each group of factors below please fill in a number on the bubble sheet to indicate the *relative impact* of each factor on your LEARNING overall in this course. (Leave blank any factors you did not participate in.)

		<i>relative impact</i> on your <u>LEARNING</u> overall				
<u>ACTIVITIES</u>		negative		neutral		positive
34)	lab lecture	1	2	3	4	5
35)	wet lab	1	2	3	4	5
36)	computer lab	1	2	3	4	5
37)	exams	1	2	3	4	5
38)	quizzes	1	2	3	4	5
39)	homework/exercises	1	2	3	4	5

For each group of factors below please fill in a number on the bubble sheet to indicate the *relative impact* of each factor on your CONFIDENCE in your ability to understand and do chemistry. (Leave blank any factors you did not participate in.)

		<i>relative impact</i> on your <u>CONFIDENCE</u>				
<u>ACTIVITIES</u>		negative		neutral		positive
40)	lab lecture	1	2	3	4	5
41)	wet lab	1	2	3	4	5
42)	computer lab	1	2	3	4	5
43)	exams	1	2	3	4	5
44)	quizzes	1	2	3	4	5
45)	homework/exercises	1	2	3	4	5

For each group of factors below please fill in a number on the bubble sheet to indicate the *relative impact* of each factor on your ENTHUSIASM for learning chemistry. (Leave blank any factors you did not participate in.)

		<i>relative impact</i> on your <u>ENTHUSIASM</u>				
<u>ACTIVITIES</u>		negative		neutral		positive
46)	lab lecture	1	2	3	4	5
47)	wet lab	1	2	3	4	5
48)	computer lab	1	2	3	4	5
49)	exams	1	2	3	4	5
50)	quizzes	1	2	3	4	5
51)	homework/exercises	1	2	3	4	5

For each row please fill in one number on the bubble sheet which best represents your view.

<u>LECTURE</u>		strongly disagree				strongly agree	
52)	I enjoyed the formal laboratory (1 hour) lectures.	1	2	3	4	5	
53)	The organization of the lectures was important for my learning.	1	2	3	4	5	
54)	The applications of chemistry discussed in this course made certain concepts easier to understand.	1	2	3	4	5	
55)	The applications of chemistry discussed in this course made learning chemistry interesting.	1	2	3	4	5	

The survey continues on the following page.

	<b><u>LABS</u></b>	<b>strongly disagree</b>				<b>strongly agree</b>
56)	I enjoyed the labs.	1	2	3	4	5
57)	The organization of the labs was important for my learning.	1	2	3	4	5
58)	I understood the chemistry behind the labs before I did them.	1	2	3	4	5
59)	Eventually I understood the chemistry behind the labs.	1	2	3	4	5
60)	The labs helped me understand important concepts in this course.	1	2	3	4	5
61)	The labs related well to the CH 302 lecture material.	1	2	3	4	5
62)	Enough time was allowed for labs.	1	2	3	4	5

**GENERAL: (Fill in the appropriate response)**

63) Average hours per week spent on this course:	<b>For...</b>	<b>0</b>	<b>1-5</b>	<b>5-10</b>	<b>15-20</b>	<b>Over 20</b>
	<b>Fill in...</b>	1	2	3	4	5

64) What one resource was most important in helping you understand the concepts presented in this course?

<b>For...</b>	<b>Fill in...</b>
THE INSTRUCTOR/PROFESSOR/HEAD TA OF THE COURSE	1
THE TA ASSIGNED TO YOUR SECTION	2
OTHER STUDENTS IN THE COURSE	3
THE LAB MANUAL	4
THE CH 302 TEXTBOOK	5

65) What one resource was most important in helping you complete the experiments in this course?

<b>For...</b>	<b>Fill in...</b>
THE INSTRUCTOR/PROFESSOR/HEAD TA OF THE COURSE	1
THE TA ASSIGNED TO YOUR SECTION	2
OTHER STUDENTS IN THE COURSE	3
THE LAB MANUAL	4
THE CH 302 TEXTBOOK	5

66) What one resource was most important in helping you prepare the laboratory reports in this course?

<b>For...</b>	<b>Fill in...</b>
THE INSTRUCTOR/PROFESSOR/HEAD TA OF THE COURSE	1
THE TA ASSIGNED TO YOUR SECTION	2
OTHER STUDENTS IN THE COURSE	3
THE LAB MANUAL	4
THE CH 302 TEXTBOOK	5

## Appendix E: Statements on the Survey

The following table shows the numbering used in all versions of the survey and how these versions were compiled into a common numbering scheme for purposes of analysis.

Table A1: Statements on the Survey

Statement	Item Numbers				New #

<i>IMPRESSIONS OF LECTURE</i>					
I enjoyed the lectures. (Rephrased as I enjoyed the formal laboratory (1 hour) lectures for B, C, D)	96	71	50	52	43
The organization of the lectures was important for my learning.	97	72	51	53	44
The professor was concerned about my learning chemistry.	98	–	–	–	–
The professor made students feel comfortable asking questions.	99	–	–	–	–
The applications of chemistry discussed in this course made certain concepts easier to understand.	100	73	52	54	45
The applications of chemistry discussed in this course made learning chemistry interesting.	101	74	53	55	46
<i>IMPRESSIONS OF EXAMS</i>					
The lectures and assigned work adequately prepared me for exams.	102	75	–	–	–
Taking the exams increased my understanding of the course material.	103	76	–	–	–
I sometimes developed new insights from taking the exams.	104	77	–	–	–
<i>IMPRESSIONS OF LABS</i>					
I enjoyed the labs.	105	78	54	56	47
The organization of the labs was important for my learning.	–	79	55	57	–

Table A1 continues on the next page

Table A1, continued

Statement	Item Numbers				
	Version of Survey	New #			
I understood the chemistry behind the labs before I did them.	106	80	56	58	48
Eventually I understood the chemistry behind the labs.	107	81	57	59	49
The labs helped me understand important concepts in this course.	108	82	58	60	50
The labs related well to the lecture material.	109	83	—	—	—
The labs related well to the CH 302 lecture material.	—	—	59	61	—
Enough time was allowed for labs.	110	84	60	62	51
The lab instructor was helpful.	111	—	—	—	—
<i>GENERAL QUESTIONS</i>					
Average hours each week spent on this course	112	85	61	63	—
Would you recommend this course to a friend?	113	86	62	33	52
When did you take CH 302 (or its equivalent)?	—	—	28	28	—
Did your General Chemistry lecture experience help you in your laboratory course?	—	—	29	29	—
Did you use the General Chemistry textbook to help solve problems in your laboratory course?	—	—	30	30	—
Do you see value in taking laboratory courses?	—	—	31	31	—
How closely do the skills presented in this lab match your academic and/or career goals?	—	—	—	32	—

66,67	Apply your Knowledge of Chemistry to the Real World	2.292 $\pm$ 1.221	3.446 $\pm$ 1.186	1.154
68,69	Understand Other Areas of Science	2.892 $\pm$ 1.239	3.692 $\pm$ 0.951	0.800
70, 71	Succeed in Another Chemistry Course	2.908 $\pm$ 1.284	3.492 $\pm$ 1.239	0.585
72,73	Succeed in a Chemistry-Related Discipline	2.785 $\pm$ 1.244	3.400 $\pm$ 1.321	0.615

Table A6: Student Self-Reported Interest in Science Areas in the Experimental Group, Fall 1998

Items	Statement	Before	After	Change
74, 75	Studying Chemistry in General	2.585 $\pm$ 1.345	3.077 $\pm$ 1.315	0.492
76, 77	Taking More Chemistry	2.385 $\pm$ 1.259	2.815 $\pm$ 1.467	0.431
78, 79	Pursuing a Chemistry-Related Major	2.046 $\pm$ 1.525	2.092 $\pm$ 1.627	0.046
80, 81	Pursuing a Science-Related Field	3.646 $\pm$ 1.351	4.000 $\pm$ 1.118	0.354
82, 83	Working with Others to Learn Science	3.077 $\pm$ 1.291	3.662 $\pm$ 1.253	0.585
84, 85	Chemistry in Industry	2.077 $\pm$ 1.407	2.400 $\pm$ 1.589	0.323
86, 87	Chemistry in Agriculture	1.815 $\pm$ 1.357	2.015 $\pm$ 1.441	0.200
88, 89	Chemistry in Medicine	3.391 $\pm$ 1.341	3.938 $\pm$ 1.180	0.547
90, 91	Chemistry in Athletics	2.431 $\pm$ 1.541	2.892 $\pm$ 1.562	0.462
92, 93	Chemistry in the Environment	2.415 $\pm$ 1.467	3.000 $\pm$ 1.521	0.585
94, 95	Science in General	3.723 $\pm$ 1.218	4.123 $\pm$ 0.910	0.400

The remaining survey responses are presented in Table A7.

Table A7: Survey Responses for Survey Items 96-113, Fall 1998

Item	Statement	Control	Experimental	New #
<i>IMPRESSIONS OF LECTURE</i>				
96	I enjoyed the lectures.	2.000 $\pm$ 1.549	2.308 $\pm$ 1.560	43
97	The organization of the lectures was important for my learning.	2.739 $\pm$ 1.769	2.708 $\pm$ 1.476	44
98	The professor was concerned about my learning chemistry.	2.283 $\pm$ 1.846	3.846 $\pm$ 1.337	
99	The professor made students feel comfortable asking questions.	2.600 $\pm$ 1.912	3.703 $\pm$ 1.477	
100	The applications of chemistry discussed in this course made certain concepts easier to understand.	2.644 $\pm$ 1.612	3.323 $\pm$ 1.324	45
101	The applications of chemistry discussed in this course made learning chemistry interesting.	2.591 $\pm$ 1.661	3.246 $\pm$ 1.287	46
<i>IMPRESSIONS OF EXAMS</i>				
102	The lectures and assigned work adequately prepared me for exams.	2.214 $\pm$ 1.601	3.723 $\pm$ 1.375	
103	Taking the exams increased my understanding of the course material.	2.357 $\pm$ 1.605	3.538 $\pm$ 1.404	
104	I sometimes developed new insights from taking the exams.	2.357 $\pm$ 1.635	3.277 $\pm$ 1.398	
<i>IMPRESSIONS OF LABS</i>				
105	I enjoyed the labs.	2.681 $\pm$ 1.617	3.246 $\pm$ 1.347	47
106	I understood the chemistry behind the labs before I did them.	2.652 $\pm$ 1.433	2.446 $\pm$ 1.212	48
107	Eventually I understood the chemistry behind the labs.	3.370 $\pm$ 1.323	3.875 $\pm$ 0.968	49

Table A7 continues on the next page

Table A7, continued

Item	Statement	Control	Experimental	New #
108	The labs helped me understand important concepts in this course.	$3.043 \pm 1.429$	$3.723 \pm 1.023$	50
109	The labs related well to the lecture material.	$3.068 \pm 1.469$	$3.692 \pm 1.030$	
110	Enough time was allowed for labs.	$3.196 \pm 1.721$	$4.338 \pm 0.889$	51
111	The lab instructor was helpful.	$3.978 \pm 1.437$	$4.662 \pm 0.594$	
<i>GENERAL QUESTIONS</i>				
112	Average hours each week spent on this course	$2.500 \pm 1.070$	$2.285 \pm 0.820$	
113	Would you recommend this course to a friend?	$1.522 \pm 1.683$	$3.477 \pm 1.501$	52

## Appendix G: Survey Responses, Spring 1999

Presented below is the complete set of responses for the survey distributed in Spring 1999. The original survey numbering is shown here. The data are broken into Tables A8, A9, A10, A11, A12, and A13, corresponding to different sections of the survey.

Table A8: Survey Responses for Survey Items 8-55, Spring 1999

Item	Statement	Control	Experimental	New #
<i>IMPACT ON LEARNING</i>				
8	Activities: Lecture	3.611 $\pm$ 0.964	3.397 $\pm$ 0.958	10

Table A12: Student Self-Reported Interest in Science Areas in the Experimental Group, Spring 1999

Items	Statement	Before	After	Change
53, 54	Studying Chemistry in General	$2.862 \pm 1.069$	$3.354 \pm 1.120$	0.492
55, 56	Taking More Chemistry	$2.900 \pm 1.099$	$3.169 \pm 1.149$	0.269
57, 58	Pursuing a Chemistry-Related Major	$2.554 \pm 1.233$	$2.808 \pm 1.393$	0.254
59, 60	Pursuing a Science-Related Field	$3.922 \pm 1.087$	$4.192 \pm 0.973$	0.270
61, 62	Working with Others to Learn Science	$3.208 \pm 1.098$	$3.762 \pm 1.133$	0.554
63, 64	Chemistry in Industry	$2.631 \pm 1.094$	$2.892 \pm 1.283$	0.262
65, 66	Chemistry in the Environment	$2.915 \pm 1.141$	$3.231 \pm 1.178$	0.315
67, 68	Chemistry in Medicine	$3.562 \pm 1.093$	$3.931 \pm 1.149$	0.369
69, 70	Science in General	$3.876 \pm 0.919$	$4.140 \pm 0.882$	0.264

Table A13: Survey Responses for Survey Items 71-86, Spring 1999

Item	Statement	Control	Experimental	New #
<i>IMPRESSIONS OF LECTURE</i>				
71	I enjoyed the formal laboratory (1 hour) lectures.	3.147 $\pm$ 1.158	2.717 $\pm$ 1.221	43
72	The organization of the lectures was important for my learning.	3.324 $\pm$ 1.249	3.299 $\pm$ 1.129	44
73	The applications of chemistry discussed in this course made certain concepts easier to understand.	2.765 $\pm$ 1.182	3.630 $\pm$ 1.060	45
74	The applications of chemistry discussed in this course made learning chemistry interesting.	2.176 $\pm$ 1.193	3.449 $\pm$ 0.982	46
<i>IMPRESSIONS OF EXAMS</i>				
75	The lectures and assigned work adequately prepared me for exams.	2.500 $\pm$ 0.984	3.921 $\pm$ 1.066	
76	Taking the exams increased my understanding of the course material.	2.438 $\pm$ 1.134	3.740 $\pm$ 1.121	
77	I sometimes developed new insights from taking the exams.	2.375 $\pm$ 0.942	2.717 $\pm$ 1.221	
<i>IMPRESSIONS OF LABS</i>				
78	I enjoyed the labs.	2.412 $\pm$ 1.131	3.685 $\pm$ 1.059	47
79	The organization of the labs was important for my learning.	2.529 $\pm$ 1.285	3.795 $\pm$ 0.979	
80	I understood the chemistry behind the labs before I did them.	2.353 $\pm$ 1.228	3.024 $\pm$ 1.050	48
81	Eventually I understood the chemistry behind the labs.	2.765 $\pm$ 1.232	4.063 $\pm$ 0.856	49
82	The labs helped me understand important concepts in this course.	2.794 $\pm$ 1.122	4.000 $\pm$ 0.900	50

Table A13 continues on the next page

Table A13, continued

<b>Item</b>	<b>Statement</b>	<b>Control</b>	<b>Experimental</b>	<b>New #</b>
83	The labs related well to the lecture material.	$3.088 \pm 1.111$	$4.094 \pm 0.921$	
84	Enough time was allowed for labs.	$2.886 \pm 1.430$	$4.457 \pm 0.804$	51
<i>GENERAL QUESTIONS</i>				
85	Average hours each week spent on this course	$3.257 \pm 0.886$	$2.913 \pm 0.836$	
86	Would you recommend this course to a friend?	$1.618 \pm 1.045$	$3.903 \pm 1.172$	52

## Appendix H: Survey Responses, Fall 1999

Presented below is the complete set of responses for the survey distributed in Fall 1999. The original survey numbering is shown here.

Table A14: Survey Responses, Fall 1999

Item	Statement	Control	Experimental	New #
<i>CONFIDENCE IN YOUR ABILITY TO...</i>				
10	Understand Key Concepts of Chemistry	3.541 $\pm$ 0.954	3.728 $\pm$ 0.915	25

<i>IMPRESSIONS OF LECTURE</i>				
52	I enjoyed the formal laboratory (1 hour) lectures.	2.415 $\pm$ 1.096	2.657 $\pm$ 1.167	43
53	The organization of the lectures was important for my learning.	3.016 $\pm$ 1.218	3.133 $\pm$ 1.075	44
54	The applications of chemistry discussed in this course made certain concepts easier to understand.	2.883 $\pm$ 1.091	3.533 $\pm$ 0.981	45
55	The applications of chemistry discussed in this course made learning chemistry interesting.	2.580 $\pm$ 1.116	3.362 $\pm$ 1.102	46
<i>IMPRESSIONS OF LABS</i>				
56	I enjoyed the labs.	2.463 $\pm$ 1.234	3.217 $\pm$ 1.211	47
57	The organization of the labs was important for my learning.	2.864 $\pm$ 1.153	3.575 $\pm$ 1.069	
58	I understood the chemistry behind the labs before I did them.	2.629 $\pm$ 1.113	2.962 $\pm$ 1.162	48
59	Eventually I understood the chemistry behind the labs.	3.222 $\pm$ 1.069	4.019 $\pm$ 0.926	49
60	The labs helped me understand important concepts in this course.	2.808 $\pm$ 1.068	3.724 $\pm$ 0.935	50
61	The labs related well to the CH 302 lecture material.	2.941 $\pm$ 1.164	2.962 $\pm$ 1.097	
62	Enough time was allowed for labs.	3.553 $\pm$ 1.141	4.009 $\pm$ 1.159	51
<i>GENERAL QUESTIONS</i>				
63	Average hours each week spent on this course	3.117 $\pm$ 0.682	3.257 $\pm$ 0.680	
64	What one resource was most important in helping you understand the concepts presented in this course?	2.787 $\pm$ 1.169	2.781 $\pm$ 1.160	

Table A19 continues on the next page

Table A19, continued

Item	Statement	Control	Experimental	New #
65	What one resource was most important in helping you complete the experiments in this course?	2.871 $\pm$ 0.911	2.877 $\pm$ 0.923	
66	What one resource was most important in helping you prepare the laboratory reports in this course?	3.140 $\pm$ 1.057	3.202 $\pm$ 0.907	

Table A20: Survey Responses for Experimental and PENS Groups, Spring 2001

Item	Statement	Experimental	PENS	New #
	<i>CONFIDENCE IN YOUR ABILITY TO...</i>			
10	Understand Key Concepts of Chemistry	3.916 $\pm$ 0.791	3.667 $\pm$ 1.042	25
11	Solve Chemistry Problems	3.869 $\pm$ 0.825	3.811 $\pm$ 0.995	26
12	Understand the Chemistry Underlying Lab Experiments	3.551 $\pm$ 0.934	2.946 $\pm$ 1.053	27
13	Perform Lab Experiments	3.868 $\pm$ 0.794	3.703 $\pm$ 1.102	28
14	Visualize Key Concepts of Chemistry	3.689 $\pm$ 0.760	3.297 $\pm$ 1.077	29
15	Apply your Knowledge of Chemistry to the Real World	3.349 $\pm$ 0.895	3.000 $\pm$ 1.054	30
16	Understand Other Areas of Science	3.981 $\pm$ 0.730	3.946 $\pm$ 0.970	31
17	Succeed in Another Chemistry Course	3.849 $\pm$ 0.848	3.919 $\pm$ 1.010	32
18	Succeed in a Chemistry-Related Discipline	3.566 $\pm$ 0.873	3.459 $\pm$ 1.120	33
	<i>INTEREST IN..</i>			
19	Studying Chemistry in General	2.962 $\pm$ 1.112	3.162 $\pm$ 1.214	34
20	Taking More Chemistry	2.811 $\pm$ 1.303	3.027 $\pm$ 1.323	35

## **Vita**

Michael Jeffrey Elliott was born in Hopewell, Virginia, the son of Joan Booth Elliott and William R. Elliott, Jr. After completing his work at Hopewell High School, Hopewell, Virginia, in 1979, he entered the University of Virginia. He received his Bachelor of Arts in Chemistry and French in 1983. Returning to the University of Virginia in 1984, he entered the Graduate School, eventually earning the Master of Arts in Teaching in Chemistry in 1988. During the following years, he was employed as Laboratory Instructor and Stockroom Manager at Barry University, Miami Shores, Florida. In August 1997, he entered the Graduate School of The University of Texas.
