Dear Dr. S t e n z e l .

With the same post I send you a separatum on micropaleontology and ecology .

My studies in Geology, especially Sedimentary Petrology, are now enlarged with Foraminiferology. The greater part of the study took place in the Netherlands under Dr. J. HOFKER and Dr. J. H. van VOORTHUYSEN, micropaleontologist of the Geological Survey, Haarlem. During the summer months I had also geological field work to do for the Geological Survey. The new results are used for the revision of the geological map.

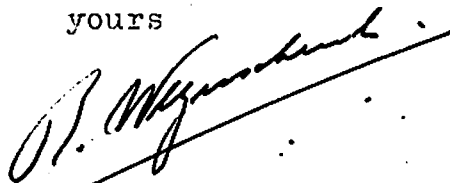

I sent also a publication in the English language to the Journal of Paleontology, concerning triassic Foraminifera with ecological remarks. Also many thanks for sending my article, concerning the discovery of Dolomites of recent and young geological date of large mass and extent, to Dr. J. Hough, which however didn't confirm the receipt of the manuscript.

As far as I know you are ~~a~~ Paleontologist, aren't you, and I should be most grateful, to hear your opinion with regard to the new foraminiferal Family VENTROLOAMINIDAE.

I will start again now, making all efforts to come to the US. It is not so easy to get a job in your country. In case you hear of openings at research institutions I should be most grateful if you let me know them. I hope you will apologize last question.

With best wishes, I am sincerely

yours

R. Weynschenk.
